

Vibration Control

Catalog 2007

Your Technology Specialist

simrit[®]

The information in this product catalog is based on the experience gained in decades of research on the development and manufacture of seals and components for vibration control in the Freudenberg group. It represents the current state of our knowledge.

The sealing effect of many products in the catalog is, however, not provided solely by the component. Indeed, in the specific application this effect depends on other parameters such as installation position and contact area, the pressure applied, operating temperature, media to be sealed, lubrication, vibration control-related effects and any ingress of dirt from the outside. This and other, unknown, factors in practical use can have a significant effect on the seals.

Against this background, general statements on the function of the products in the catalog are not possible. Information in this catalog only represents recommended values that are not correct

in every application. We therefore recommend you to discuss your specific application with our advisory service. In cases with high or special loads, for example due to aggressive media, the seal should be selected in collaboration with us; here trials on reliability are often indispensable.

In the context of product optimisation we reserve the right to change, without prior notice, the product range, production sites, products and their manufacturing process as well as the information in this catalog.

All previous issues become invalid on publication of this issue of the catalog.

Duplication in any form requires express approval from Freudenberg Simrit GmbH & Co. KG, 69465 Weinheim, Germany.

Vibration Control

Our unique service package sets standards in quality, functionality and cost effectiveness throughout the industry.

With its comprehensive product range and large number of services, Simrit provides a service package unique in the market for almost every application. Simrit employs its leading technological expertise so that you benefit: We analyse your entire system and fine-tune the individual components to each other in an optimum way. This means you get exactly the solution that best fulfils your requirements – cost effective and dependable. Reinforced by single sourcing that saves time and costs, you will find that Simrit is your ideal partner for all sealing- and vibration-related applications when it comes to complex systems.

We have been the leading experts in materials for decades, and this is a significant factor for success, exceptional performance and continuous technological advancement of our products. Famous product names such as Simmering®, Merkel, Integral Accumulator, ISC O-Ring or Lederer reflect this. Together with the fields of special sealing products and vibration technology, they are inseparably connected with the Simrit brand name and constitute the world's largest product range for all applications throughout industry.

As part of the Freudenberg Group, we draw upon established research, development and production expertise within the Group to constantly extend our technological lead through innova-

tive solutions for the purposes of – and in the service of – our global customers with their local market requirements. The close international cooperation of Simrit in Europe and America with our Japanese partner, NOK, in Asia provides you with consistent quality standards wherever our solutions are required. And with Simrit Service Centers in all industrial markets, our global sales network supports you and more than 100,000 other customers dependably and on a basis of mutual trust and cooperation at sites in every continent.

The Simrit service package at a glance:

- **World's largest product range**
Comprehensive solutions from a single source
- **Continuous innovations**
Technological prominence for the competitive advantage of our customers
- **Unique expertise in materials and high quality standards**
Leading know-how for safe and cost-effective applications
- **A huge number of integrated services**
Support from development up to continuous product deployment
- **Globality**
Global expertise with the knowledge of local market requirements

Your Simrit Partner

Elastomers with Excellent Characteristics – the Basis of Innovative Solutions

Thorough know-how about materials for more than 60 years

Simrit has now been developing innovative branded products at the highest level for more than 60 years. With in-depth experience on materials, well-founded knowledge of processing and extensive product know-how, again and again we create ideal pre-conditions for your success. However, the quality of the elastomer material is decisive for the optimum operation of seals and components used in vibration control. Therefore, we are particularly proud of our pioneering role worldwide in this sector.

Deliberately targeted development of materials guarantees the highest possible quality and long life

More than 250 engineers and chemists worldwide are developing new materials every day for the highest possible functional requirements in joint development ventures with various research institutions plus leading manufacturers of polymers and chemicals. The materials we develop must fulfil the respective customer-specific requirements and withstand all the loadings feasible in their branch of industry – both with regard to temperature, pressure and resistance to media and in the presence of static or

dynamic loadings. The length of life of our products is constantly being improved by optimising our materials. Constant monitoring on the road to these products becoming mass production materials also guarantees you the highest possible quality.

The Individual Materials We have Developed are Leaders Worldwide

Uniquely wide range of standard materials

We produce more than a billion seals annually from a production volume of more than 15,000 tons. When considered as a whole, a range of material, which is unique in its quality and quantity, is available to you with more than 1,500 mixtures of 850 raw materials for your individual applications in seals and vibration control. A large proportion of these are standardised mixtures. Of course, our competent team of experts will advise and assist you fully – from the selection of the right materials via the test phase to the start of production.

Comprehensive performance package and much more

Materials manufactured individually to your wishes and requirements are unusually important in the comprehensive performance package from Simrit. The use of polymers, based on our own raw materials and tailored to your requirements, enables Simrit to develop high performance materials which satisfy the highest functional demands. We use our global materials database for the selection of application-specific materials, which groups together the know-how

of our experts, working worldwide, to form a network of top technological services which we can call on at any time. Finally, the appropriate material with the optimum characteristics for your application is manufactured using computer-controlled procedures, from the selection of the raw material to the compounding process. Of course, always adhering to the highest standards in quality and processing and complying with ecological guidelines – in the interests of your success and the environment.

Simrit Academy – Secure these Advantages for Your Success

The Simrit Academy offers you seminars which are tailored to your needs in terms of content and specialisation levels. There are numerous advantages for you.

A know-how advantage

You receive information from more than 20 qualified experts with regards to state of the art products and materials. Thus ensuring the correct selection of parts as well as smooth workflows in your production processes.

Individuality

Our seminar programme covers the needs of beginners and pros alike. The selection is extensive, allowing for a choice appropriate to the level of knowledge.

Practical relevance

Reinforcement of theoretical knowledge through practical exercises. At the same time we invite you to view our production and research facilities.

Productivity

With the knowledge that you have gained, you can increase your productivity by appropriately selecting the correct products and materials every time.

Languages

All attendance seminars are offered in both German and English. Simultaneous translation is available at every Innovations Forum.

Sustainability

For each Simrit Academy event, you will also receive comprehensive documentation to accompany the course information. Your participation is substantiated by DIN-ISO 9001 format seminar certificate.

Simrit Seminars

You visit our Academy on location in Weinheim and directly experience all materials and products yourself. In doing so, you can choose one of three different seminar categories.

Simrit Basic Seminar

Participants without previous technical knowledge can get to know the entire Simrit performance package.

Simrit Professional Seminar

Become an expert on Simrit and obtain detailed knowledge about all products, processes and materials. Both in theory and in practice.

Simrit Seminar Special

The course contents are highly specialised and concentrate on conveying knowledge related to a specific product or material area.

Innovation Forum

Interested parties learn about all the new Simrit innovations in this lecture series, and can exchange knowledge and experience with panels of experts and with other participants.

Registration

You can easily register for Simrit seminars at www.simrit.com/academy. Additional detailed information on registering and on the seminars can be found in the Simrit Academy Programme 2007 brochure, which you can order or download from www.simrit.com.

Merkel Xpress – The 24 hour Express-Service for Seals, Guides and Pivoting Parts

When it has to be there in a hurry: Merkel Xpress from Simrit. Our service delivers the desired seal within 24 hours.

With Merkel Xpress from Simrit you can minimise your machine down-time – and therefore production costs. At the same time, you can reduce the number of spare parts you keep in stock. After all, if you can order it at any time, you don't need to keep it in stock. Ask us: you'll have your seal tomorrow.

The seal you need

Whatever you need at short notice, we can produce it within a few hours using state-of-the-art production technology. Tailor-made to suit your requirements, from single seals for prototypes through to mass production in economical batch sizes. Merkel Xpress saves you shaping costs and minimum order quantities – by using new materials and thanks to our high-speed production and delivery systems.

Merkel Xpress offers you:

- Delivery within 24 hours
- Seals of up to 4 metres in diameter
- From single seals to mass production
- Wide range of profiles
- Original Simrit materials and geometries
- Plus special designs and special materials
- Leading production know-how
- Continuous development of the product range

Tailor-made. Immediately. Economically. The Triple Advantage of Merkel Xpress

Materials

Polyurethane:

SQ-PU
SQ-HPU

Further materials:

- For low-temperature ranges (down to -50°C)
- Self-lubricating properties
- With FDA approval

Elastomers:

SQ-NBR
SQ-HNBR
SQ-FKM (fluorelastomer)
SQ-EPDM*
SQ-SIL*

* Also with FDA approval (food safe)

Plastomers:

SQ-POM
SQ-PA

Fluoroplastic (PTFE):

SQ-WFLON (white, virginal)
SQ-GFLON (with 15% glass fibre, 5% MoS₂)
SQ-BFLON (with 40% bronze, or 60%)
SQ-CFLON (25% carbon)

Further qualities on request.

A flexible production concept for every requirement

With the newest generation of special lathes and software solutions developed to precisely satisfy customer demands, we can produce every machine-manufactured seal possible, quickly and economically. More than 260 pre-programmed seal design types serve as a basis for our efficient and rapid manufacturing processes. In this regard we work with both special materials such as PEEK and

FFKM, Original Simrit polyurethane and, of course, upon request every other market-standard material for your specific application. The perfect solution for:

- Non-standard seal and machined-part spare parts for every manufacturer
- Rapidly required standard seals
- Small-volume series of special seals
- Samples
- Substitute seals
- End-of-life design types whose series production will not be restarted

Further information can be found at www.simrit.com.

Realise Your Objectives
Quickly with www.simrit.com

Simrit Online – more than just a facelift. Thanks to a smart Navigation System – developed exactly to your requirements – the information you are looking for can be found about products and services with just a few mouse clicks.

The new online presence from Simrit, with integrated Smart Navigation, offers you a particularly easy and quick work platform for your Internet research. There's no quicker way for you to achieve your objective of getting solid expertise for your planning. Whether you need product information, material data sheets or want to access 3D-CAD data – in the user-friendly Simrit database you are sure to quickly find what you are looking for.

3D-CAD data – Download added value

With the 3D Download Service from Simrit you can reliably create your designs with visual clarity for your seal or vibration control solution. Including all technical details in three-dimensional display quality.

The new Simrit eCatalog

Up to 100.000 items accessible online and available within 24 hours. The new eCatalog in the Simrit portal makes it possible. And the best thing about it: The Simrit Product Navigator guides you in the easiest and most straightforward manner directly to the optimum product for your application. Find – compare – select. Convince yourself.

mySimrit – the easy, exclusive offering for smart online users

Register once – benefit continuously. As a registered user of the mySimrit customer area, you benefit from the continuously expanding service advantages. From initial query through product availability to quick CAD downloads and even accessing current news, you receive true added value for a minimum of registration effort. The best thing to do is test us today.

We speak your language:

As a worldwide leading technology specialist, of course we also make our Internet services available to you in your native language. Right from the start, our new online presence is represented in the national language of the most important industrial markets. And, we are continually expanding our portal for you.

Simrit on the Internet – your platform for successful business

- Smart navigation and full-text searches for rapid results
- An extensive eCatalog with more than 100.000 items
- Easy download function for 3D-CAD
- An overview of our brochure service by mouse click
- Availability query
- and much more

Hydro Bush

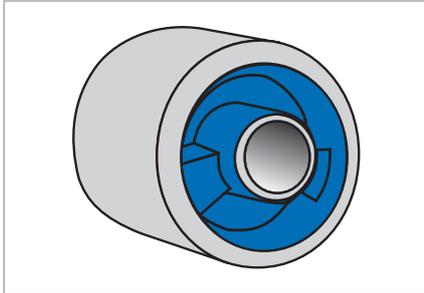

Fig. 1 Hydro Bush

Material

Standard material	Hardness
Natural rubber NR 11	35, 45, 55, 62, 68 Shore A

Operating conditions

Compressive forces in Z direction	1100 N ... 4200 N	Maximum permissible force
Max. temperature	+60 °C, transient +80 °C	
Min. temperature	-45 °C	

Product description

Hydro bushes are elastomer springs with integrated hydraulic damping.

Product advantages

- Frequency & amplitude selective damping
- Integrated limitation of the spring displacement
- Allowing twist in all directions
- Easily installed
- RoHS-compliant.

Application

Suitable for mountings of combustion engines, cabs, pumps and compressors, mainly in agricultural machines and construction machinery.

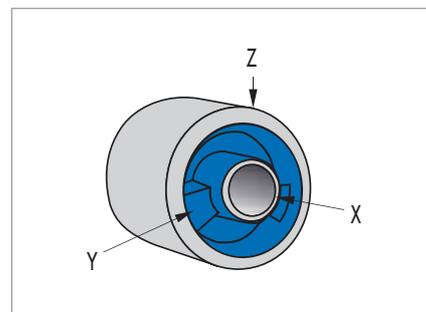

Fig. 2 Primary load directions

They are specifically suited when low frequencies occur as excitation frequency in the mount system. They achieve a high damping in the natural frequency range of the system as well as gut isolation properties above this range. Vibrations in the mount system which have a sound-conducting or radiating characteristic, generated primarily through excitation amplitudes or dynamic forces in the audible frequency range

are significantly reduced. The integrated hydraulic mechanism in the bush with the frequency and amplitude dependent damping is designed for effect in the Z direction. By matching the damping maximum of the hydro bush to the critical frequency (resonance frequency) of the spring-supported mass, the resonance magnification can be noticeably reduced. For higher frequencies, the insulating capability of elastomer bond components can be utilised. The hydro bushes are designed so that the translatory stiffness increase in the order X,Z,Y. The bushes are designed for the primary load in the radial (Z direction) as well as the axial direction (X direction) but can also absorb slight cardanic and torsional deformations. Depending on the design, limiters for deflection (labelled as HD) with or without reinforcement can be integrated in the Z direction.

Design notes

The mount configuration comprises an elastomer-metal composite with load-bearing element in Vee-shape, stops, fluid chambers and overflow ducts. The composite is mounted in an outer sleeve and fluid-filled.

Fitting & installation

- Hydro bushes have an outside fit and accommodate a threaded fastener on the inside for installation
- Hydro bushes can be secured with Loctite or other, similar adhesive if a press fit is not desired
- Individual components permit slight adjustment to allow for in-situ offset
- Always install hydro bushes centred and at right angles to the axis of primary radial load and if possible, utilise the entire cylindrical surface area of the outer sleeve as the bearing surface
- If possible, utilise the entire cylindrical length of the inner sleeve bore as the bearing surface
- Position the bush relative to the weight load in such a way as to reduce the largest distance between the axis of the inner sleeve to the axis of the outer sleeve in the place through both axes.

Hydro Mount DL

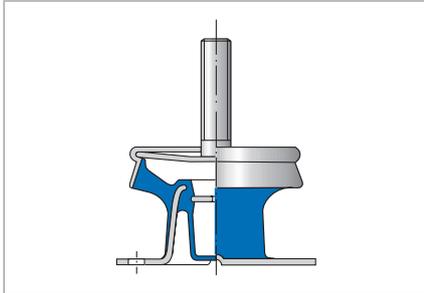

Fig. 1 Hydro Mount DL

Product description

The hydro mount, as a hydraulically damping rubber mount, solved the designer's conflict of how to mount a mass that is excited by wide frequency spectrum. Particularly if low frequencies – between 5 Hz and 15 Hz – can occur as the excitation frequency, on the one hand high damping in the natural frequency range of the system, and on the other, a good isolation property above this natural frequency (supercritical mounting) is necessary.

Product advantages

- Frequency & amplitude selective damping
- Cross-stiffness
- Integrated capability for levelling the load
- HD version for "extra-hard" use
- RoHS-compliant.

Application

Hydro Mounts DL are suitable for use as mounts for pumps, compressors and engines in utility vehicles and in boats and for vehicle superstructures, particularly driver's cabs.

Material

Standard material	Hardness
Natural rubber NR 11	40, 45, 50, 55, 60, 65 Shore A

Operating conditions

Compressive forces in Z direction	700 N ... 1700 N	Maximum permissible force
Max. temperature	+60 °C, transient +80 °C	
Min. temperature	-45 °C	

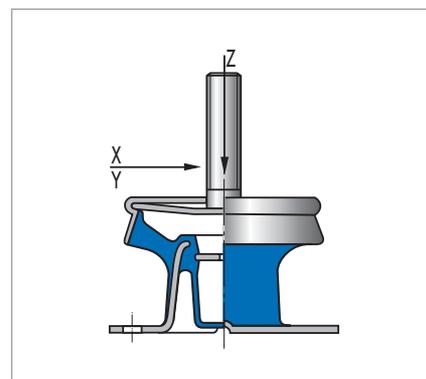

Fig. 2 Primary load directions

Hydro Mounts DL are predominantly used in vehicles of all types. In these applications the related assembly must be mounted as softly as possible to achieve a good structure-borne sound isolation. At low frequencies near the natural frequency of the spring-mass system engine/engine mounts, such soft mounting results in inadmissibly high amplitudes at the motor. Hydro Mounts DL have a soft spring characteristic and thus a large static deflection.

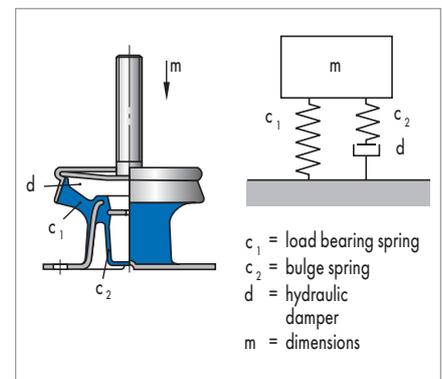

Fig. 3 Mode of operation

The hydraulic mechanism with frequency and amplitude dependent damping integrated in the mount is designed for effect in the Z direction. By matching the damping maximum of the mount to the critical frequency (resonance frequency) of the spring-supported mass, the resonance magnification can be noticeably reduced. For higher frequencies, the insulating capability of elastomer bond components can be utilised. These hydro mounts have a greater flexibility in the Z direction than in the X,Y direction. Hydro mounts are designed for primary loading in the axial as well as radial direction but they can also withstand cardanic deformation. The longitudinal axis should be selected for the introduction of the static primary load.

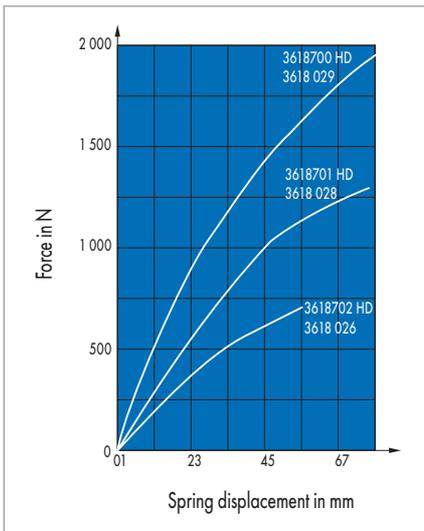

Fig. 4 Static spring characteristic curve in Z direction

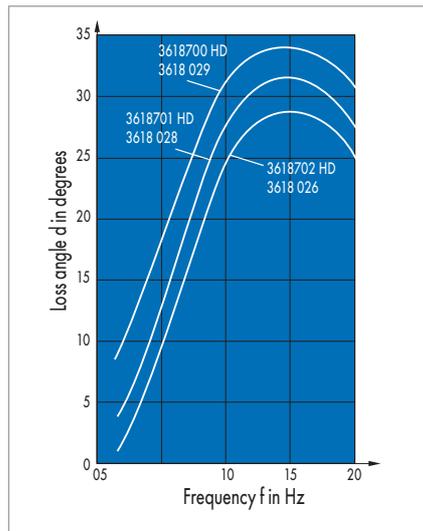

Fig. 5 Transient of the loss angle as a function of frequency

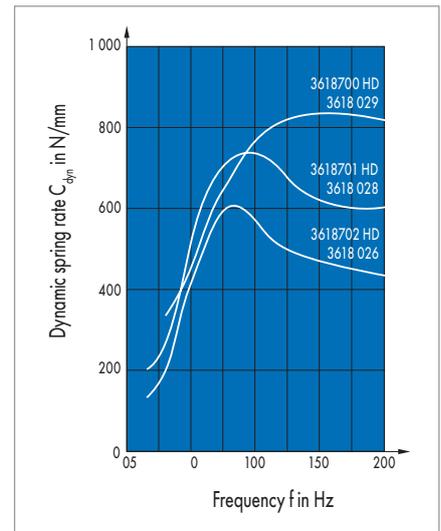

Fig. 6 Dynamic spring rate as a function of frequency

Design notes

The mount configuration comprises a conical mount with integrally moulded/integral expansion bellows with threaded stud. The expansion bellows is filled with a special fluid. A control plate is located between the expansion bellows and the securing plate for setting of the specific hydraulic damping characteristics.

Fitting & installation

- Hydro mounts are designed to be secured by means of the threaded fastener with securing plate assembly and the flange of the conical mount
- Individual components permit slight adjustment to allow for in-situ offset or angular offset
- It is important to ensure that the mating faces of the frame and the mass carried by the mount are flat and smooth
- In particular, the area underneath the flange mount must be free of sharp edges, burrs and filings, so that the rubber element can expand on it without risk of damage
- Position the mount relative to the static load in such a way that securing plate and flange are preloaded relative to each other
- Use HD-rated hydro mounts by preference for applications with extra-harsh conditions characterised by many hard shock loads: fork-lift trucks running on solid-rubber tyres is a typical example.

Hydro Mount VL

Fig. 1 Hydro Mount VL

Application

The Hydro Mount VL offers a wide range of possible applications such as cab and engine mounts, for agricultural and construction machinery, industrial

vehicles, forest machinery, communal vehicles, ships and for mounting superstructures, pumps and compressors. It is equally suited for mounting machinery and systems/units with severe resonance transients.

Material

Standard material	Hardness	Special design
Natural rubber NR 11	40, 45, 50, 55, 60, 65 Shore A	on enquiry

Product description

The mount design, the chosen fluid and the hydraulic mechanism provide the characteristic wide-band damping. In cases with remote excitation frequencies in the lower frequency range, the use of this hydro mount permits an optimal mounting. By precise reduction of the fluid chamber stiffness of one of the chambers, a significantly improved compromise of effective vibration reduction and structure-borne sound isolation is achieved as opposed to the hydro mounts without this design.

Operating conditions

Axial forces in Z direction	3000 N ... 8500 N	Maximum permissible force
Max. temperature	+60 °C, transient +80 °C	
Min. temperature	-45 °C	

Product advantages

- Broad-band damping at high amplitudes
- Significantly reduced damping at low amplitudes
- Optimised elastomer spring
- Compact
- RoHS-compliant.

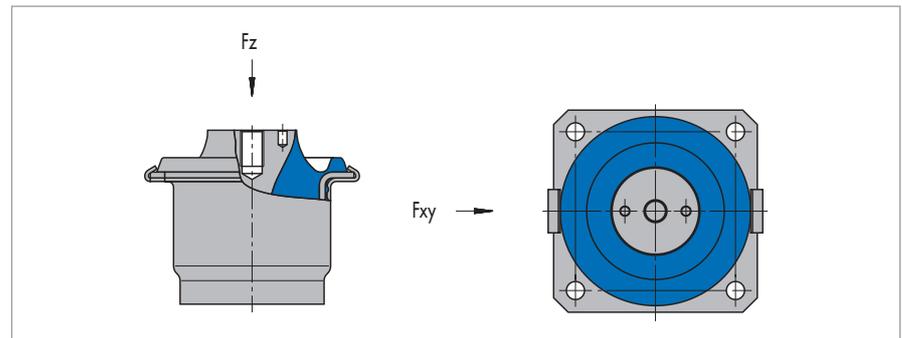

Fig. 2 Primary load directions

The hydraulic mechanism with frequency and amplitude dependent damping integrated in the mount is designed for effect in the Z direction. The effective damping over the wide-band frequency is also present for changes to the spring-supported mass. At low excitation amplitudes, the Hydro Mount VL has a significantly reduced damping. Hydro

Mounts VL have a greater flexibility in the Z direction as in the X,Y direction. The mount configuration is designed for primary loading in the axial as well as radial direction but it can also withstand cardanic deformation. The longitudinal axis should be selected for the introduction of the static primary load.

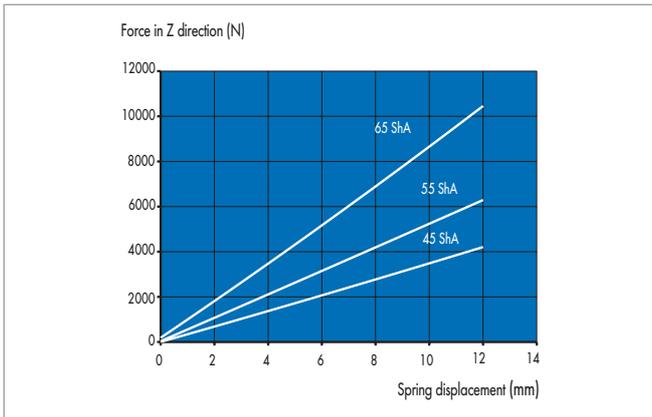

Fig. 3 Force-deflection characteristics, 036 18 704

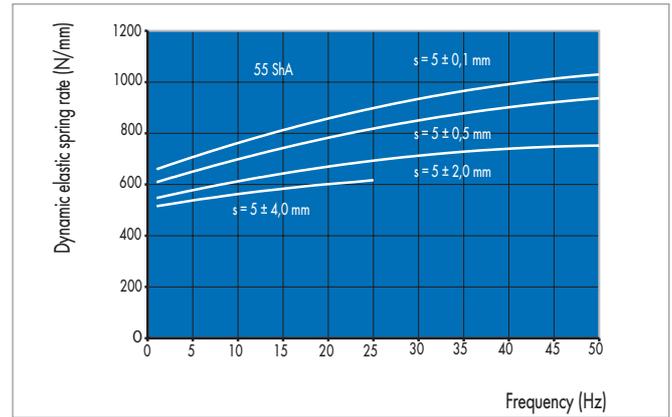

Fig. 4 Dynamic spring rate, 036 18 704; 55 ShA

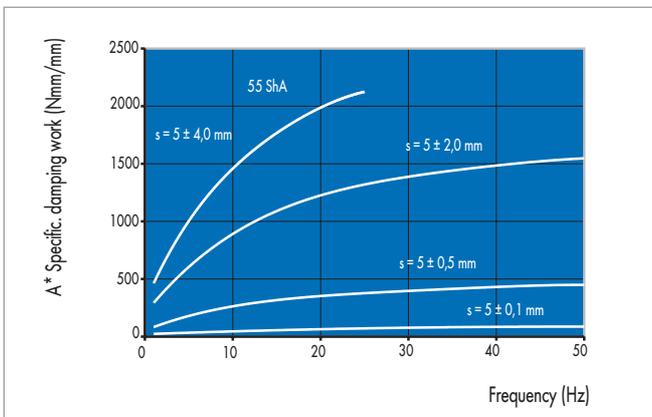

Fig. 5 Specific damping work, 036 18 704; 55 ShA

Design notes

The mount configuration comprises a conical mount with outer metal component with rectangular flange and bore holes. It also contains an inner metal component with central thread hole to which a washer is attached which extends into a fluid-filled chamber. This is formed by the tapered mount and the cup mounted on the tapered mount. The base of the cup is closed off with a diaphragm.

Fitting & installation

- Hydro Mounts VL are designed to be secured by means of threaded fasteners
- Individual components permit slight adjustment to allow for in-situ offset
- The flat part of the flange must make full-surface contact with the supporting structure
- It is important to ensure that the mating face is flat and smooth, and the same applies to the mating face of the mass carried by the mount. It is also important to ensure full-surface contact with the inner metal part of the mount
- Position the mount relative to the static load in such a way that the inner metal part of the conical mount and the flange are preloaded relative to each other.

Hydro Mount KL

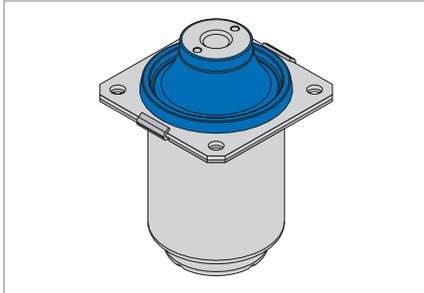

Fig. 1 Hydro Mount KL

Product description

The new Hydro Mount KL is ideally suited for mounting systems with the highest comfort and acoustic demands. The mount configuration can be individually adjusted to suit the specific customer application.

Product advantages

- Characteristics can be customised to suit the specific application
- Frequency and amplitude-selective damping
- Good insulation at low excitation amplitudes
- Optimised elastomer spring
- Two selectable cross-stiffness stages
- Can be used in combination with sturdy tensile stops
- RoHS-compliant.

Application

Through the use of the Hydro Mount KL, an efficient, narrow-band damping effect in a wide frequency range is achieved. This resilient connecting element thus has wide application for the mounting of cabs, superstructures, engines, pumps and compressors.

Material

Standard material	Hardness
Natural rubber NR 11	40, 45, 50, 55, 60, 65 Shore A

Operating conditions

Axial forces in Z direction	1900 N ... 8200 N	Maximum permissible force
Max. temperature	+60 °C, transient +80 °C	
Min. temperature	-45 °C	

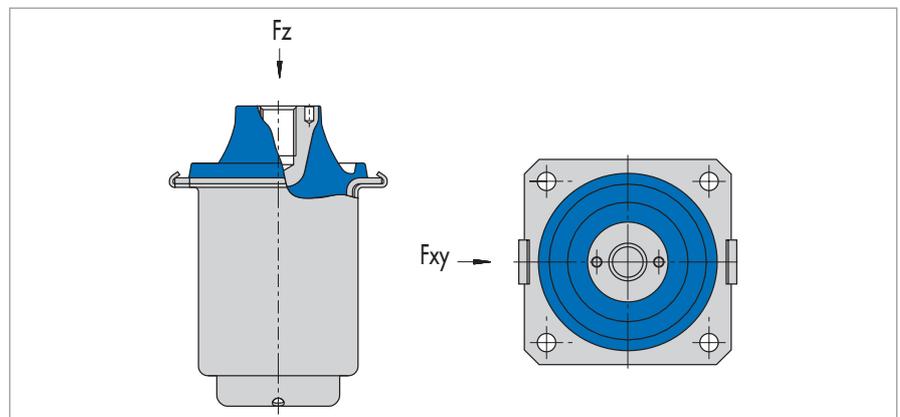

Fig. 2 Primary load directions

The mount component can be specifically mounted with different components for realising different definable characteristics which are primarily based on the additional hydraulic damping characteristics to the conical mount characteristics. The integrated hydraulic mechanism in the mount with the frequency and amplitude dependent damping is designed for effect in the Z direction. By matching the damping maximum of the mount to the critical frequency (resonance frequency) of the spring-supported mass, the resonance magnification can be noticeably reduced. With small excitation amplitudes (structure-borne noise), these mounts have a very slight damping. The Hydro Mounts KL have a greater flexibility in the Z direction than in the X, Y direction; The stiffness relationship has two adjustment levels. They are designed for the primary loading in axial and

radial direction but can also withstand cardanic deformation. The longitudinal axis should be selected for the introduction of the static primary load.

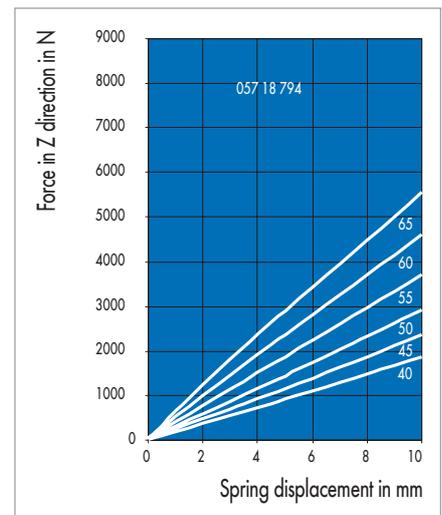

Fig. 3 Static spring characteristic curves in Z direction

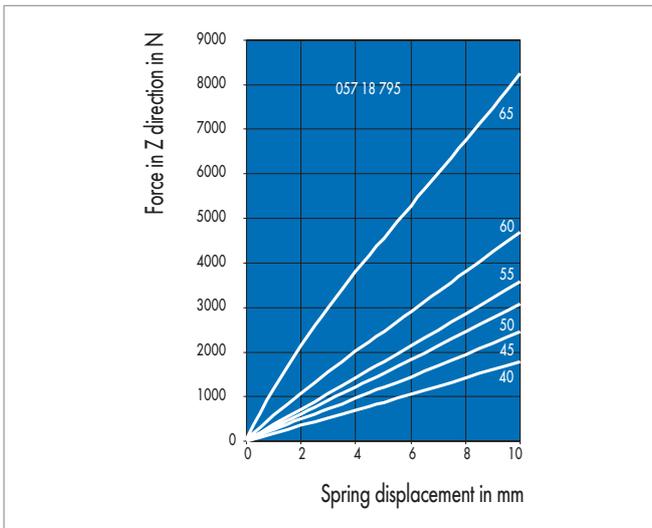

Fig. 4 Static spring characteristic curves in Z direction

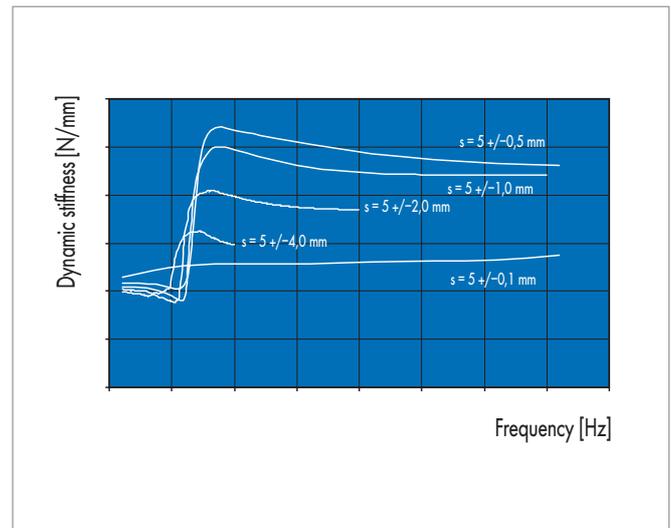

Fig. 5 Dynamic stiffness

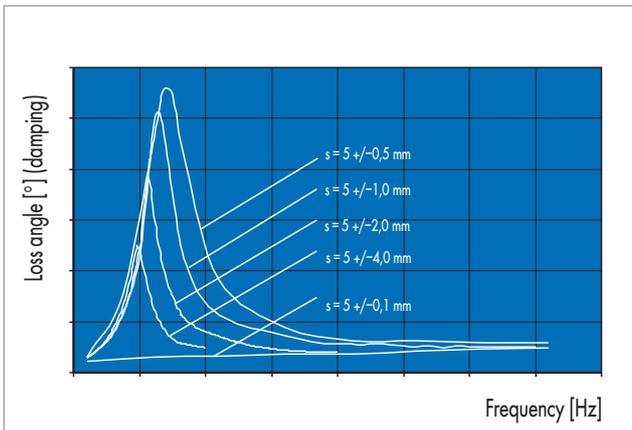

Fig. 6 Transient of the loss angle as a function of frequency (example, qualitative)

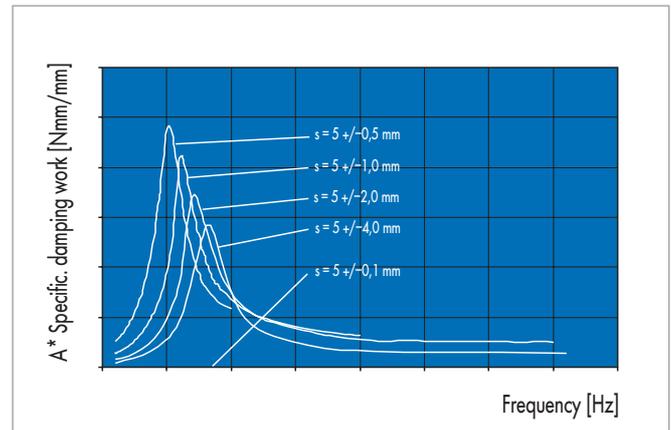

Fig. 7 Specific damping work as a function of frequency (example, qualitative)

Design notes

The component consists of conical mount and hydraulic element filled with a special damping fluid and formed by a cylindrical sheet-steel housing containing a fluid-tight, roll-shaped diaphragm.

Fitting & installation

- Hydro Mounts KL are designed to be secured by means of the threaded fastener through the core and in the flange of the mount
- Individual components permit slight adjustment to allow for axial, radial or angular in-situ offset
- The flat part of the flange must make full-surface contact with the supporting structure

- Size the diameter of the bore only a few tenths of a millimetre larger than the diameter of the housing (108 mm) or as a slight interference fit
- Ensure that the mating face is flat and smooth, and the same applies to the mating face of the mass carried by the mount. It is also important to ensure full-surface contact with the inner metal part of the mount
- Position the mount relative to the static load in such a way that the inner metal part of the conical mount and the flange are preloaded relative to each other.

Ultra Bush

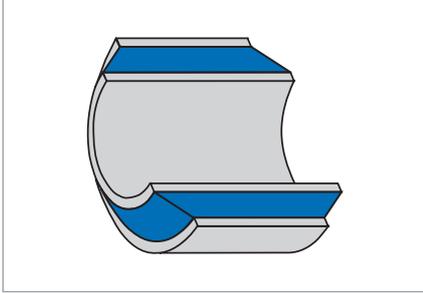

Fig. 1 Ultra Bush

Product description

The ultra bush is a cylindrical bush capable of absorbing axial, radial and torsional movements and cardanic deflections.

Product advantages

- Maintenance-free
- Prevents sound transmission
- Adjustment of manufacturing tolerances
- Usable as a coupling element in drives/powertrains

- Reduced settling under radial load
- Increases load-bearing capability in the radial direction
- RoHS-compliant.

Application

Ultra bushes have a wide range of possible applications as resilient connecting element. Typical applications are elastic articulations on vibrating machines or bearing blocks for shafts, axles as well as steering gears and couplings.

Material

Standard material	Hardness
Ethylene-acrylate rubber AEM 23, AEM 33	60 Shore A
Natural rubber NR 11, NR 91, NR 39, NR 97	40, 45, 60, 70 Shore A
Acrylonitrile-butadiene rubber NBR 68	60 Shore A

Operating conditions

Radial forces	350 N ... 460000 N	Maximum permissible force
Axial forces	120 N ... 60000 N	Maximum permissible force
Max. temperature	60 °C, transient +80 °C	
Min. temperature	-45 °C	

Ultra bushes are available in different versions by the specified article (see article list) which range for applications up to load ranges of 460 kN. Ultra bushes can tolerate radial axial, torsional and also slight cardanic deformation. The recommended primary loading direction is perpendicular to the longitudinal axis and centred to the longitudinal elongation (radial load).

When calculating dynamic loading, use values of s_a and s_r reduced by approx. 50%.

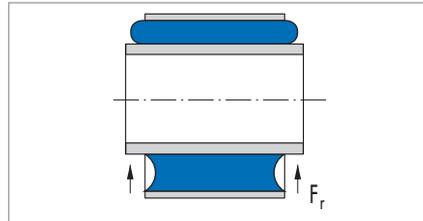

Fig. 2 Radial load

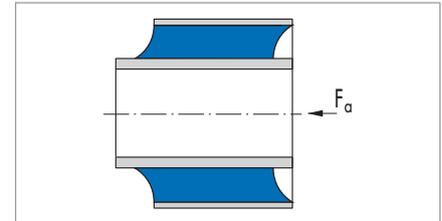

Fig. 3 Axial load

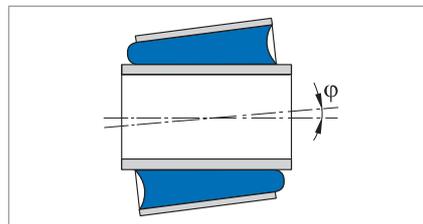

Fig. 4 Cardanic deflection

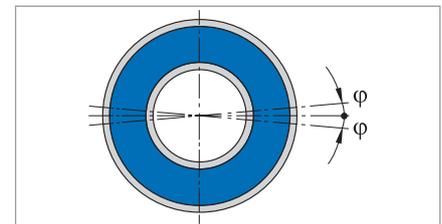

Fig. 5 Torsional load

Design notes

They are manufactured from an inside and outside precision metal sleeve which are joined together by a vulcanised elastomer insert. Ultra bushes have a pressure "preloaded elastomer" that is produced by permanently reducing the outside diameter of the outer sleeve and increasing the inside diameter of the inner sleeve through plastic deformation of the metal parts. This increases the service life considerably.

Fitting & installation

- Ultra bushes are designed for inner and outer press fitting
- Individual components permit slight adjustment to allow for in-situ planar or angular offset
- If possible, ensure that the entire cylindrical surface area of the sleeves is utilised as load-bearing contact surface
- Always apply installation and removal press-fit forces uniformly to the end faces of the precision sleeves.

O-Bush

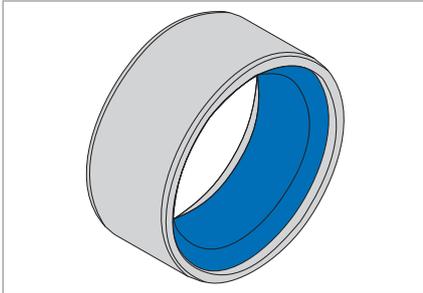

Fig. 1 O-Bush

Product description

O-bushes receive forces in the radial direction. They isolate and compensate for tolerances of the stud. Radial deflection of the mass carried by the mount is also limited.

Product advantages

- Low weight
- Low space requirements
- Independent centring
- Tolerance compensation
- RoHS-compliant.

Application

The O-bushes are particularly suitable as a resilient connecting element for mounting auxiliary units, electronic components, small units, pumps and compressors in mobile and stationary applications.

Material

Standard material	Hardness
Natural rubber NR 11, NR 13	50, 60, 70 Shore A
Acrylonitrile-butadiene rubber NBR 68	50, 60, 70 Shore A
Chloroprene rubber CR 57	50, 60, 70 Shore A

Operating conditions

O-bushes have different stiffness in axial and radial direction. In the radial direction the stiffness is many times that of the axial direction. The primary load direction is recommended to be perpendicular to the longitudinal axis and central to the longitudinal extension.

Design notes

The O-bush with central through-bore consists of a pipe section with an elastomer pad vulcanised to its inner sheath. It can be designed in an axial and a radial direction. During assembly the elastomer pad is compressed radially. This makes the O-bush self-holding, forms the friction connection between the elastomer pad and the stud and increases the service life. The radial stiffness depends on the size of the cover. Only slight forces should be applied in the axial direction.

Fitting & installation

- O-bushes are prepared externally for installation in a locating bore with press fitting
- The internal dimensions are designed for press-in of a stud with cover
- A slight axial offset required by the installation is possible depending on the component
- Always apply installation and removal press-fit forces uniformly to the end faces of the pipe section.

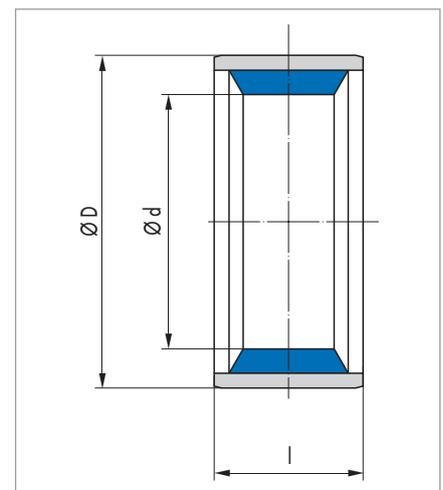

Fig. 2 Dimensional drawing of O-Bush

Spherical Mount

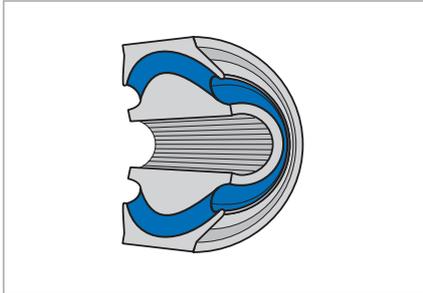

Fig. 1 Spherical Mount

Product description

Spherical mounts, as the name suggests, are spherical bushes capable of absorbing axial, radial and torsional movements and cardanic deflections.

Product advantages

- Maintenance-free articulation
- Reduced settling under radial load
- Increased cardanic loading
- Allowing twist in all directions
- RoHS-compliant.

Application

Spherical mounts are ideal vibration-control components for articulations that are subjected to twisting in all directions. The mounts are primarily used in bearings, brake levers and steering gears in buses and trucks as well as in reaction-support links in industrial applications.

Material

Standard material	Hardness
Natural rubber NR 11, NR 13	50, 60, 65, 70 Shore A

Operating conditions

Radial forces	1200 N ... 46000 N	Maximum permissible force
Axial forces	1600 N ... 20000 N	Maximum permissible force
Max. temperature	up to +60 °C, transient up to +80 °C	
Min. temperature	up to -45 °C	

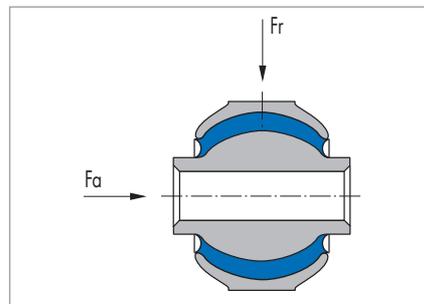

Fig. 2 Primary load directions

Spherical mounts are generally stiffer in the radial direction than in the axial direction and permit angular deflections of 4°–9° for all three spatial axes.

Design notes

This component consists of an inner ball and an outer spherical shell; the joining element is a vulcanised elastomer insert between ball and shell. Spherical mounts have a preloaded rubber element, so, as is the case with Ultra Bushes, the mount can be calibrated (see the description of Ultra Bushes) for extended durability.

Fitting & installation

- As a rule, spherical mounts are designed for press fitting of the outer metal part and have a threaded fastener on the inner metal part
- Alternatively, the inner metal ball can be designed to push onto a stud for preloading against a collar or for press-fitting on a stud

- Individual components permit slight adjustment to allow for in-situ planar or angular offset
- If possible, utilise the entire cylindrical surface of the outer sleeve as the bearing surface for spherical mounts
- If the inner stud has threaded ends, ensure full-surface contact of the flats in the threaded fastener
- If the inner sleeve is thin, if possible, utilise the entire cylindrical inner face of the inner-sleeve bore as the bearing surface of the spherical mount
- Always apply installation and removal press-fit forces uniformly to the end faces of the precision sleeves.

Conical Mount

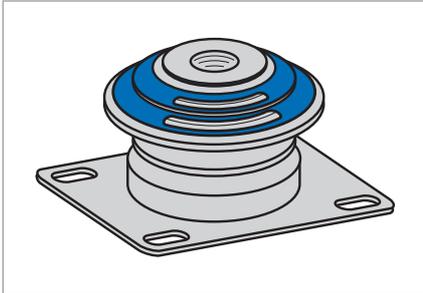

Fig. 1 Conical Mount

Product description

Conical mounts damp vertical vibrations, isolate against structure-borne noise and can simultaneously accept large horizontal forces (e.g. deceleration forces under braking). Conical mounts are delivered without washers as standard. The suitable washers and stops can be found in the section on Washers and Centering Washers as well as in Rubberised Stop Washers.

Product advantages

- Long service life
- Optimum settling
- Auto-centring under axial load
- RoHS-compliant.

Application

Conical mounts are ideal, resilient connecting elements for mounting engines, driven machinery and superstructures for both stationary operation and in vehicles and ships.

Material

Standard material	Hardness
Natural rubber NR 11, NR 39	35, 40, 45, 50, 55, 60, 65, 70, 76, 80 Shore A
Acrylonitrile-butadiene rubber NBR 68	55, 65, 70 Shore A
Ethylene-acrylate rubber AEM 33	55, 60 Shore A

Operating conditions

Axial forces	500 N ... 30000 N	Maximum permissible force
Max. temperature	up to 60 °C, transient up to +80 °C	
Min. temperature	up to -45 °C	

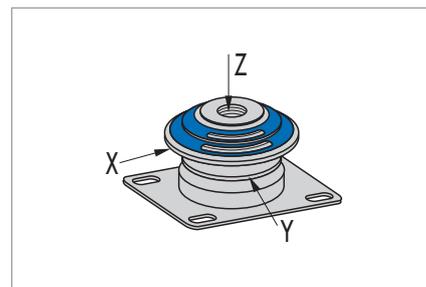

Fig. 2 Primary load directions

Properly positioned conical mounts for mounting engines lightly cushions the torque which reduces the vibrations introduced into the anchorages and thus contributes to a better running smoothness. The weight should primarily be absorbed in the longitudinal axis (+Z). The range of conical mounts offers a large number of different designs for the optimal solution of all conceivable application/installation cases. Tear-off or separation protection is also thus possible.

Design notes

The mount configuration is manufactured from an inner and outer metal part. The outer metal part has a multi-hole flange and the inner metal part has a through-hole with or without a thread or a tapped blind hole. Both tapered metal parts are connected in tapered parallel orientation by an elastomer insert.

Fitting & installation

- The conical mounts are designed to be secured by means of threaded fasteners
- Individual components permit slight adjustment to allow for in-situ offset
- It is important to ensure that the mating faces of the frame and the mass carried by the mount are flat and smooth
- Ensure that the underside of the flange is in full-surface contact with the mating face of the frame anchorage
- Position the mount relative to the static load in such a way that the inner metal part and the flange are preloaded relative to each other
- Avoid tensile loads or use the stop and centering washers to limit these loads (see the section on stop washers).

V Mount

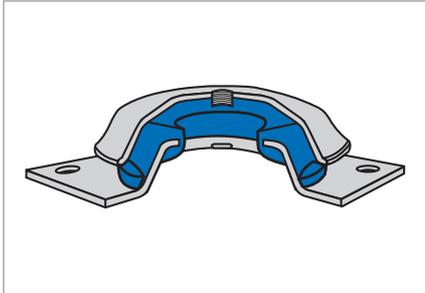

Fig. 1 V Mount

Product description

V mounts are ideal for a multiplicity of applications in vibration control and structure-borne sound insulation.

Product advantages

- Chrome-free galvanisation for optimum corrosion protection
- Easy fitting
- Maintenance-free
- Good insulation even at low interference frequencies
- RoHS-compliant.

Application

The range of possible applications for V mounts includes internal combustion engines, electric motors, pumps, compressors and tool machines. V mounts are also used for maritime engineering. There are versions with type approval from Lloyds Register of Shipping available.

Material

Standard material	Hardness
Natural rubber NR 11	40, 45, 50, 60, 65 Shore A

Operating conditions

Axial forces in Z direction	500 N ... 32000 N	Maximum permissible force
Max. temperature	up to 60 °C, transient up to +80 °C	
Min. temperature	up to -45 °C	

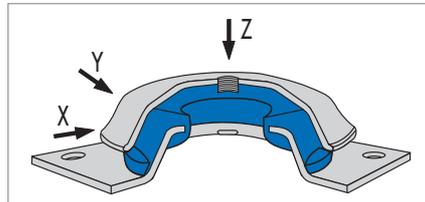

Fig. 2 Primary load directions

V mounts feature a robust compressive-deflection stop in the vertical direction (Z direction). The same high stiffness in both horizontal directions (X,Y) prevents a "floating", i.e. a lateral deflection of the vibration-insulated driven machinery, the machine or the engine. Versions with built-in tensile stops are also offered which limit the limit rebound in (-Z) direction. All V mounts are limited in their radial spring displacement at the same time. The bell-shaped designed top section of the mount protects against too strong a compressive deflection and dripping media (e.g. oil). When subjected to extreme overload a positive lock forms between the top and bottom section of the mount. The progressive spring characteristic and a thin rubber layer on the stop collar of the bottom section prevents a hard metal impact. The primary load direction (+Z) is perpendicular to the planes of attachment centred to the cap.

Design notes

V mounts comprise a flat, cylindrical metal cap with threaded insert and a base plate with rectangular flange and through-holes. Both metal parts are aligned parallel on top of each other and joined with a vulcanised elastomer insert.

Fitting & installation

- V mounts are designed to be secured by means of threaded fasteners
- Individual components permit slight adjustment to allow for in-situ offset
- It is important to ensure that the mating faces of the frame and the mass carried by the mount are flat and smooth
- Position the mount relative to the static load in such a way that the cap and the flange are preloaded relative to each other.

MO Mount

Fig. 1 MO Mount 753

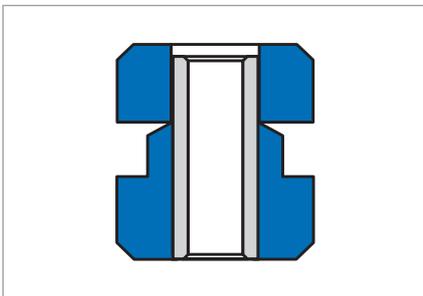

Fig. 2 MO Mount 754

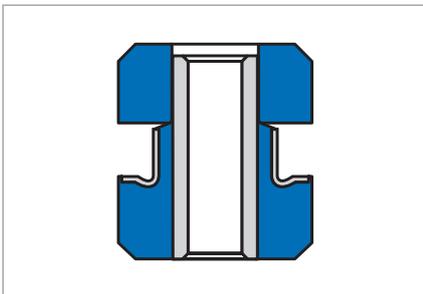

Fig. 3 MO Mount 755

Product description

MO mounts are suitable for use as resilient connecting elements.

Product advantages

- Dependable limitation of radial deflection
- Compact
- Good insulating capability in the longitudinal direction
- RoHS-compliant.

Application

The range of possible applications for MO mounts is wide, extending from applications with driven machinery, PTOs and radiators up to small cabs for vehicles, and also including attachments for exhaust-air ducts and exhaust pipes in maritime engineering.

Material

Standard material	Hardness
Chlorine-butadiene rubber CR 57	42, 45, 50, 55, 60, 64, 75 Shore A

Operating conditions

Radial forces	1000 N ... 2800 N	Maximum permissible force
Axial forces	1800 N ... 2400 N	Maximum permissible force
Max. temperature	+100 °C, transient +130 °C	
Min. temperature	-30 °C	

MO mounts feature equal stiffness in the horizontal directions (X,Y). These mounts have a greater flexibility in the Z direction which leads to a correspondingly higher isolation. The limitation of the spring displacements in the radial direction generally appear more than in the axial direction. The longitudinal axis is recommended as the primary load direction.

Design notes

The MO mount with central borehole comprises an elastomer body and a vulcanised elastomer metal part. These parts attached to each other create an annular clamping groove. This mount configuration is expandable through layers or spatially corresponding limiter components for the axial spring displacement which leads to a progressive spring characteristic curve and serves as tear-off protection at the same time.

Fitting & installation

- MO mounts are designed to accommodate a threaded fastener inserted through the central borehole
- Individual components permit slight adjustment to allow for in-situ offset
- Combine the mount with a tubular spacer if tightening torques are high
- Depending on the quality of the material selected, threaded-fasteners of at least one strength class higher can be used
- Select a tubular spacer with an outside diameter allowing slight play for the inside diameter d_1 of the MO mount
- Select the through-hole of the tubular spacer to accommodate the securing screw according to DIN EN 20273
- The surfaces for force transfer to the threaded fastener by the elastomer part should be large and flat
- Position MO mounts such that the rubber-metal part bolts directly to the component to be insulated
- Install the elastomer-only part with a washer (see the section on washers and centering washers for details of the washer)
- Make sure that the edges of bore S_D are chamfered, or preferably radiused, at both ends
- MO mounts with steel reinforcement (Type 3) require this radiusing only at the rubber-only end.

Machine Mount

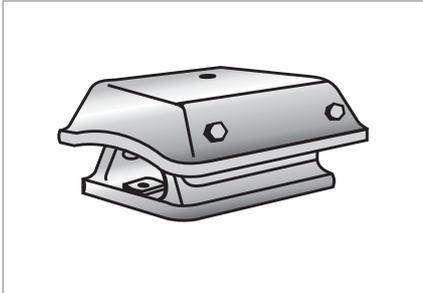

Fig. 1 Machine Mount

Product description

The special shape of the machine mount protects the built-in flat mount against mechanical damage and oil attack.

Product advantages

- Elastomer spring elements are replaceable and the metal connecting components are reusable
- Spring elements are protected against random damage and direct oil splashes
- Reduced settling in the Z direction
- RoHS-compliant.

Application

Machine mounts are particularly suitable for mounting heavy machines, compressors, engines, etc. They enable machine- and unit-generated vibrations introduced into the foundation or the enclosing building to be reduced by a significant margin.

Material

Standard material	Hardness
Natural rubber NR 11	45, 50, 55, 60, 70 Shore A

Operating conditions

Axial forces in Z direction	1400 N ... 16000 N	Maximum permissible force
Max. temperature	+60 °C, transient +80 °C	
Min. temperature	-45 °C	

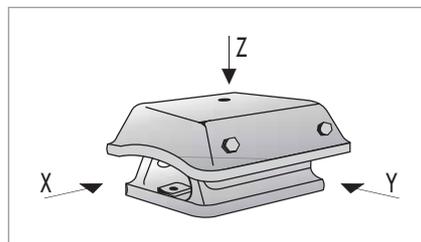

Fig. 2 Primary load directions

The combined compression and shear loading of the flat mounts fitted provides a long service life and good vibration insulation, even at lower interference frequencies (i.e. lower rotational speed). The mount is easily attached to the foundation and the machine using the standard boreholes and threads. Anchoring to the foundation and the machine permits the application of compressive loads (Z direction) to the mount as well as shear loads (X & Y direction). The primary load direction is perpendicular to the planes of attachment, centred to the cap.

Design notes

The machine mount comprises a rectangular cap and two metal parts with equally angled side faces and flange. Flat mounts are screwed in between the two stacked metal parts. Both metal parts are provided with through-holes or threaded holes.

Fitting & installation

- Machine mounts are designed to be anchored by threaded fasteners
- Individual components permit slight adjustment to allow for in-situ offset
- It is important to ensure that the mating faces of the frame and the mass carried by the mount are flat and smooth
- Position the mount relative to the static load in such a way that the cap and the flange are preloaded relative to each other.

Flat Mount

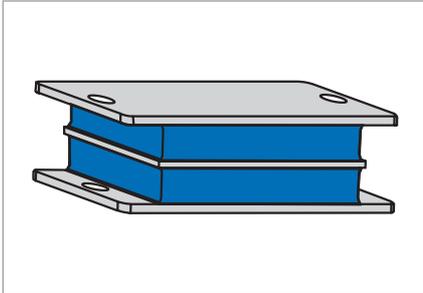

Fig. 1 Flat Mount

Product description

Flat mounts are mount configurations for custom applications.

Product advantages

- Easily integrated into assemblies
- Easily installed
- Spring characteristics can be widely adapted to the construction
- RoHS-compliant.

Application

Used as mounts for machines, engines or subassemblies in mechanical-engineering and automotive applications.

Material

Standard material	Hardness
Natural rubber NR 11	45, 50, 55, 60, 65, 70 Shore A

Operating conditions

Shear forces X,Y direction	440 N ... 7500 N	Maximum permissible force
Compressive forces in Z direction	1200 N ... 98000 N	Maximum permissible force
Max. temperature	+60 °C, transient +80 °C	
Min. temperature	-45 °C	

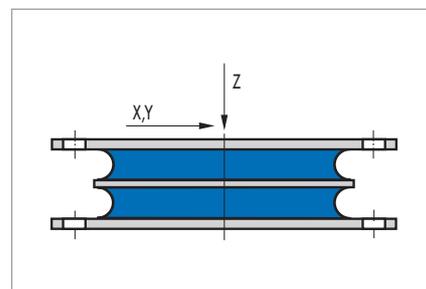

Fig. 2 Primary load directions

Depending on the installation conditions or required degree of vibration insulation, compressive loads (Z direction), shear loads (X, Y direction) or combined compressive/shear loads (mount tilted by a specific angle) can be applied to flat mounts. The mounts achieve an optimal utilisation and thus also the highest dynamic load with a compressive/shear loading. The loading is dependent on the surface area of the rubber, shape, thickness of the pad and hardness of the rubber. The static loading and the dynamic forces and deflection must be taken into account for continuous use. Flat mounts have different stiffness in the shear direction (X,Y) and compressive direction (Z) in dependence on the width, length and thickness and their total number in the mount component. The effective stiffness of the mounts can be varied by turning of the mount to the static load. The primary load direction can be absorbed perpendicular to or at an angle to the attachment levels.

Design notes

Flat mounts consist of parallel metal plates paralleled one on top of the other and separated by vulcanised elastomer pads.

Fitting & installation

- Flat mounts are designed to be secured by means of threaded fasteners
- Individual components permit slight adjustment to allow for in-situ offset
- It is important to ensure that the mating faces of the frame and the mass carried by the mount are flat and smooth
- It is also important to ensure full-surface contact between the outer metal plates and the frame and the mass carried by the mounts
- Position the mount relative to the static load in such a way that the cap and the flange are preloaded relative to each other.

Rails

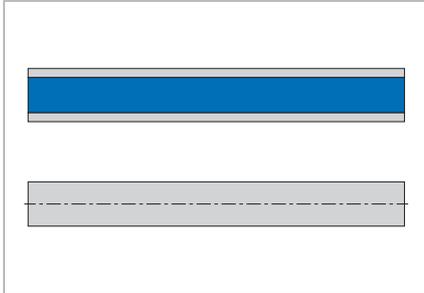

Fig. 1 Rails

Product description

Rails are often used when space is at a premium or if loads are too high to permit the use of buffers.

Product advantages

- Mount can be customised
- Rails have the flexibility to be adapted to the load
- Universal
- RoHS-compliant.

Application

Rails from Simrit are suitable for mounting the most heavy machines, plants, units and foundations. They are suitable for a wide range of possible application for mounting ships engines, large stationary engines, heavy-duty lathes, hoists for lifts as well as vibratory machines of all kinds.

Material

Standard material	Hardness
Natural rubber	57 Shore A

Operating conditions

Length of rail in mm	25 ... 2000
----------------------	-------------

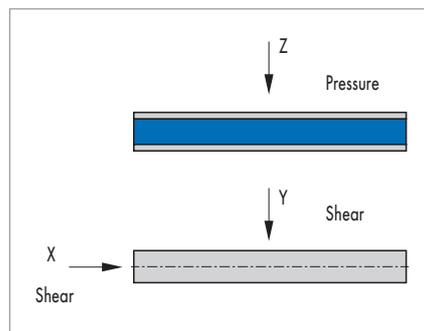

Fig. 2 Primary load directions

The rails are available in 2000 mm lengths. You must ensure that the length is not shorter than the section width. Approximately 10% of the rubber height "h" can be pressed together under static load.

Design notes

The component consists of two metal parts separated by a vulcanised elastomer pad.

Fitting & installation

- Rails can be drilled and chased on site to accommodate threaded fasteners
- Rails can also be installed without threaded fasteners if compressive-load deflection is significantly greater than maximum amplitude.

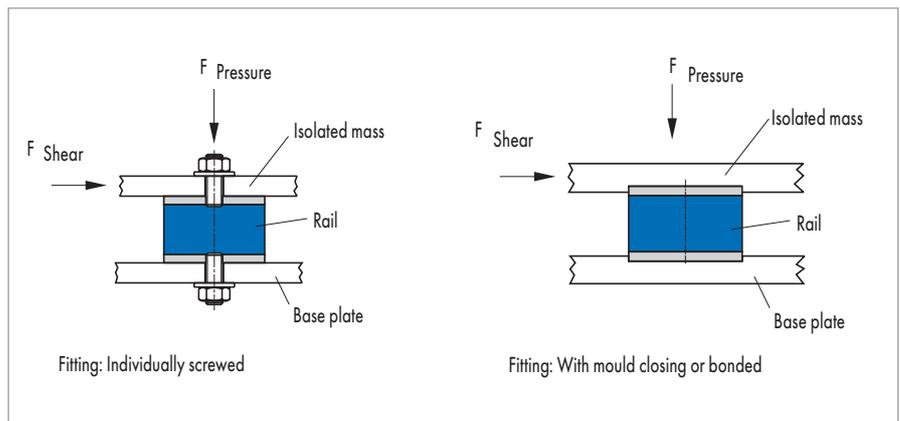

Fig. 3 Fitting & installation: rails with load directions

Tapered Mount

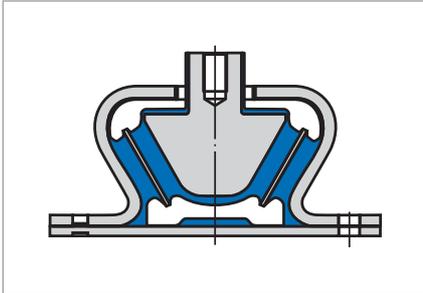

Fig. 1 Tapered Mount

Material

Standard material	Hardness
Natural rubber NR 39	40, 42, 45, 50, 60 Shore A

Operating conditions

Compressive forces in Z direction	1750 N ... 14000 N	Maximum permissible force
Max. temperature	+80 °C, transient +100 °C	
Min. temperature	-45 °C	

Product description

Tapered mounts are used primarily to carry light, medium and heavy engines for mobile and stationary applications.

Product advantages

- Robust
- Slight settling on compressive deflection in the Z direction
- Effective limitation of compressive and rebound deflection
- Limitation of horizontal spring displacement
- Narrow, ideal for mounting on steel sections
- RoHS-compliant.

Application

Tapered mounts can be utilised for agricultural and construction machinery. They are also suited for mounting generators of ships' engines.

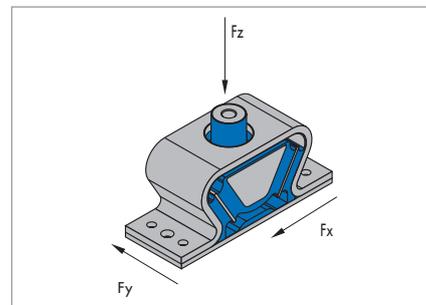

Fig. 2 Primary load directions

Tapered mounts have limiters for deflection in all spatial directions whereby the deflection in the Z direction is especially robust. In compressive-deflection direction Z, the mount also has a "soft" end stop. The stiffness depend primarily on the thickness, length, height and the wedge angle to the Z axis. Through the use of intermediate metal sheets, the Z stiffness, for example, is at least doubled for the same operating environment. The primary static load should be perpendicular to the planes of attachment.

Design notes

The tapered mount comprises an outer omega-shaped bracket with flange and through-hole. An inner metal part with threaded hole partially plunges through a borehole of the bracket. Elastomer pads are vulcanised between both metal parts in Vee shape.

Fitting & installation

- Tapered mounts are designed to be secured by means of threaded fasteners
- Avoid non-load-dependent offset of the inner metal part relative to the flange
- Individual components permit slight adjustment to allow for in-situ offset
- It is important to ensure that the mating faces of the frame and the mass carried by the mount are paralleled, flat and smooth.

Double U-Shear Mount

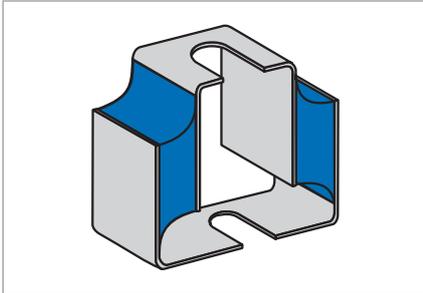

Fig. 1 Double U-Shear Mount

Product description

Double U-shear mounts are especially suited for isolation tasks. These mounts have an especially simple design and a high ease of installation.

Product advantages

- Good insulating capability in the Z direction
- Effective limitation of shock loads in the compressive-deflection direction
- Virtually no progression
- Linear characteristic
- RoHS-compliant.

Application

Double U-shear mounts are used to mount instruments, units, pumps, compactors and compressors. They are equally suitable for the decoupling of exhaust-air ducts because of their ability to compensate for structure-borne sound and thermal expansion.

Material

Standard material	Hardness
Natural rubber NR 11	45, 50, 60, 70 Shore A

Operating conditions

Shear F_z/F_y	120 N ... 2000 N	Maximum permissible force
Max. temperature	+60 °C, transient +80 °C	
Min. temperature	-45 °C	

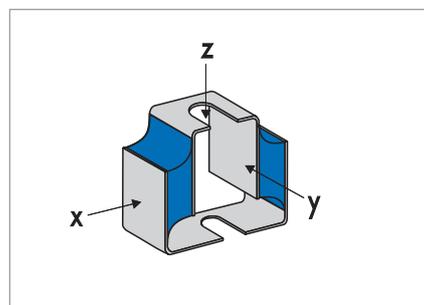

Fig. 2 Primary load directions

They are designed so that the stiffness to resist shear increases in the order Y, Z, X. Depending on the type, they limit strong shock loads in the compressive-deflection direction (+Z). The effective stiffness can be adjusted by turning the mount on the static load (Z axis). Select the primary load direction +Z so that it is perpendicular to the planes of attachment.

Design notes

A mount of this type consists of two dove-tailed U-shaped steel channel sections held together by elastomer pads.

Fitting & installation

- Double U-shear mounts have threads to accommodate grooves.
- Avoid non-load-dependent offset of the U-shaped channel sections relative to each other
- Individual components permit slight adjustment to allow for in-situ planar or angular offset
- It is important to ensure full-surface contact between the mating faces of the U-shaped channel sections and the frame on the one hand and the supported mass on the other.

Circular Mount

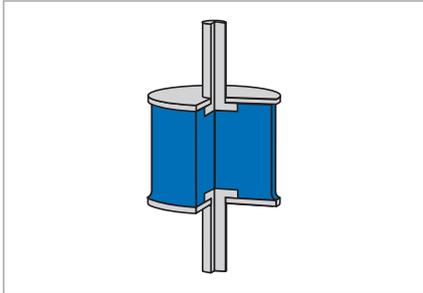

Fig. 1 Circular Mount

Product description

Circular mounts are widely used components for adjustment of tension and manufacturing tolerances. They also function as protection against shock loading.

Product advantages

- Uniform stiffness in the radial direction
- Easily installed hexagon version available
- RoHS-compliant.

Application

Circular mounts are used to carry driven machinery, engines, compressors, pumps, test machines, and so on.

Material

Standard material	Hardness
Natural rubber NR 11	45, 55, 60, 70, 75, 80 Shore A
Ethylene-acrylate rubber AEM 23, AEM 33	60 Shore A
Chloroprene rubber CR 56, CR 57	45, 60 Shore A

Operating conditions

Radial forces	14 N ... 24000 N	Maximum permissible force
Axial forces	18 N ... 80000 N	Maximum permissible force
Max. temperature	+60 °C, transient +80 °C	
Min. temperature	-45 °C	

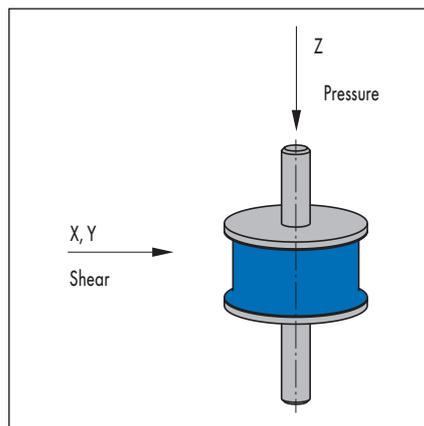

Fig. 2 Primary load directions

Circular mounts have a uniform stiffness in the shear directions X,Y. The compressive load stiffness F_{\max} in the Z direction has, depending on the component, approx. 1 to 10 times the value of the stiffness in the shear directions. The primary load direction corresponds to the shear load X,Y since this is where the greatest isolation is to be achieved.

Design notes

The circular mount comprises two round or square metal discs joined by a vulcanised rubber layer. The metal discs can each have a threaded stud or threaded nut. The circular mounts are available with cylindrical contour as well as with constricted-body elastomer contour. Mounts with constricted-body contour can be specially designed with an elongation of ~10% for high dynamic loads in the horizontal direction. The constricted design provides for significantly higher durability with high dynamic loading with otherwise equal compressive deflection.

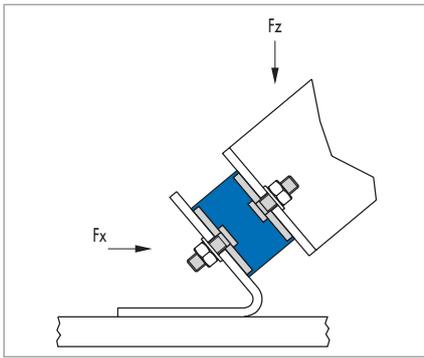

Fig. 3 Compressive and shear loading

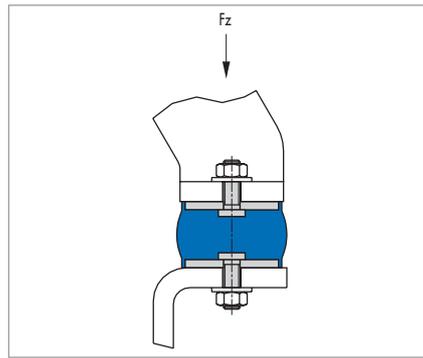

Fig. 4 Compressive loading

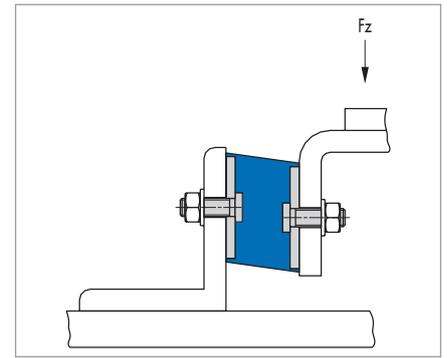

Fig. 5 Shear loading

Fitting & installation

- Circular mounts are designed to be anchored by threaded fasteners
- Avoid non-load-dependent offset of the metal plates relative to each other
- Individual components permit slight adjustment to allow for in-situ offset
- The form of the boreholes to accommodate the threaded studs or securing screws must be compliant with DIN EN 20273
- The securing plates must be in full-surface contact with the mating faces
- It is important to ensure that the mating faces of the frame and the mass carried by the mount are flat and smooth
- When installing a mount that combines a circular securing plate at one end with a hexagonal plate at the other, always tighten the fastener for the circular plate first
- Minimum strength class for screws/nuts is 4.6.

Buffer

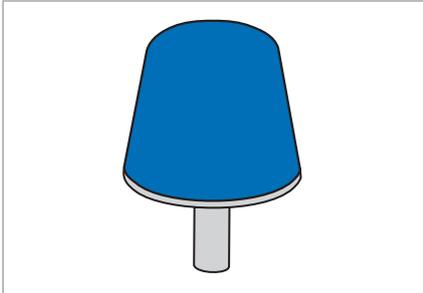

Fig. 1 Buffer

Product description

Buffers feature a very robust design. The wide selection of sizes allows for a universal use.

Product advantages

- Effective buffering and damping of shock loads
- Easily installed
- RoHS-compliant.

Application

Buffers are particularly suited as resilient deflection limiters and for buffering shock loads with mobile and non mobile driven machinery, machines and as stops in general.

Material

Standard material	Hardness
Natural rubber NR 11	40, 45, 50, 55, 60, 70 Shore A

Operating conditions

Axial forces	37 N ... 18300 N	Maximum permissible force
Max. temperature	+60 °C, transient +80 °C	
Min. temperature	-45 °C	

Buffers with constricted body contour are specifically designed for high dynamic loads. The cone-shaped buffer design (observed in the longitudinal section) achieves a "softer" transient of the characteristic curve compared to cylindrical designs. The constricted design for circular buffers leads to significantly higher service life with otherwise equal deflection. Circular buffers that contact a flat surface can generate noise on impact. Cone buffers dramatically reduce these noise levels.

Design notes

The buffers consist of an elastomer body with an end face to which a metal plate with threaded stud/nut is vulcanised. The elastomer body is available in cone-shaped, in cylindrical form as well as with constricted-body elastomer contour.

Fitting & installation

- Buffers are designed to be secured by means of threaded fasteners
- Ensure that the metal plate is in full-surface contact with the mating face
- It is important to ensure that the mating face of the frame and the stop flat of the buffered mass are flat and smooth
- The form of the boreholes to accommodate the threaded studs must be compliant with DIN EN 20273
- Align the centreline of the buffer coaxially with the direction of impact
- Do not permit torque to act through the rubber element.

M Mount

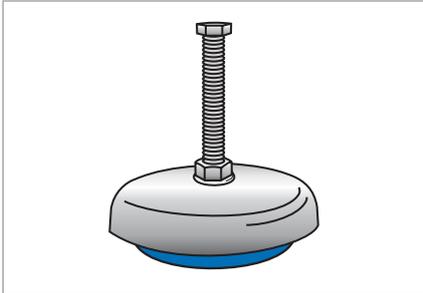

Fig. 1 M Mount

Product description

M mounts combine a low-line compact design with good insulation capabilities and the possibility of levelling load.

Product advantages

- Oil-resistant elastomer material
- Non-anchored installation
- Reduced transmission of structure-borne noise
- Good insulating capability
- Built-in capability for levelling the load
- RoHS-compliant.

Application

M mounts are used for non-anchored installation and heavy driven machinery. They feature the capacity for levelling of the attached machine and provide vibration insulation.

Material

Standard material	Hardness
Acrylonitrile-butadiene rubber NBR 68	45, 55, 60, 65, 70, 75, 85 Shore A

Operating conditions

Compressive forces in Z direction	1200 N ... 55000 N	Maximum permissible force
Max. temperature	+90 °C, transient +110 °C	
Min. temperature	-20 °C	

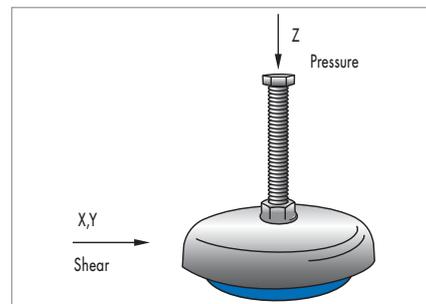

Fig. 2 Primary load directions

M mounts feature an increasing stiffness over the compressive deflection in the Z direction. Through no anchoring in the foundation or frame, no shear forces should be transferred. The weight is absorbed in the longitudinal axis. M mounts made from stainless steel and special rubber compounds can be supplied on enquiry for special application cases (e.g. food processing or chemical industries and shipbuilding).

Design notes

The mounts consist of two metal parts that are joined by a vulcanised elastomer pad. An adjusting screw allows for levelling of the attached machine. The special mixture of nitrile-rubber (Perbunan) used for the M Mount is oil-resistant.

Fitting & installation

- M mounts have an adjusting screw for securing them to the mass they carry, and are designed to sit on the supporting surface without being anchored
- Ensure that the mating face of the mass carried by the mount is parallel with the supporting surface, and make sure that the supporting surface is level and smooth
- The nut is for securing the leg of the machine to the mount
- This arrangement means that the weight of the machine does not impose a load on the nut in the bowl of the mount
- Do not under any circumstances attempt to sandwich the leg of the machine between two nuts
- The form of the boreholes to accommodate the threaded studs or securing screws must be compliant with DIN EN 20273
- It is important to ensure that the mating faces of the frame anchorage and the mass carried by the mount are flat and smooth
- M mounts can also be installed without threaded fasteners if compressive-load deflection is significantly greater than maximum amplitude.

Instrument Mount

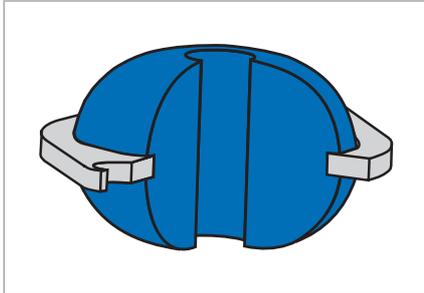

Fig. 1 Instrument Mount

Product description

The mounts protect sensitive instruments against impact and dynamic excitation.

Product advantages

- Reduced transmission of structure-borne noise
- Compact
- Easily installed
- Uniform stiffness in the radial directions
- RoHS-compliant.

Application

Instrument mounts are utilised for vibration insulation of electronic components, measuring devices and precise mechanical apparatuses and for instrument panels or control panels in industrial applications. A common requirement of these mounts is that they keep vibrations or shock loads introduced via the anchorages away from the instrument or device. The mounts help to protect sensitive instruments from external shock loads in mobile and non mobile use. Another possible use is insulation against structure-borne sound, for example in small electric engines or pumps that have to be mounted on "resonators" (sheet metal).

Material

Standard material	Hardness
Natural rubber NR 11	40, 50, 60 Shore A

Operating conditions

Axial forces	80 N ... 260 N	Maximum permissible force
Max. temperature	+60 °C, transient +80 °C	
Min. temperature	-45 °C	

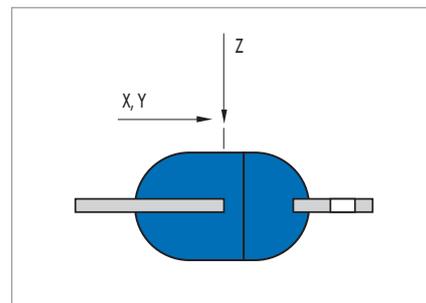

Fig. 2 Primary load directions

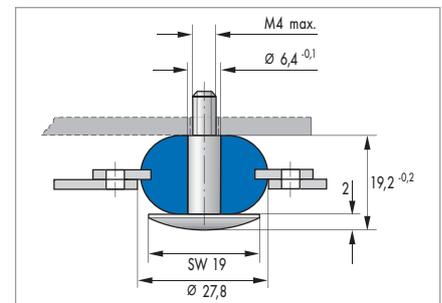

Fig. 3 Installation diagram with stud SW19

Instrument mounts are generally designed with the same stiffness in all translatory deformation directions. The limitation of the spring displacements in the radial direction generally appear more than in the axial direction. The static load of the weight should primarily be absorbed in the longitudinal axis.

Design notes

The instrument mount comprises a carrier washer with connected or vulcanised elastomer body with central through-hole. Through-holes are attached outside in the flange of the carrier washer. A stiffening metal part can be vulcanised into the middle of the elastomer body.

Fitting & installation

- Instrument mounts are designed to be anchored by threaded fasteners
- Slight, non-load-related, installation-related offset of the central securing screw relative to the flange is permissible. The same applies to slight angular offset
- Locate instrument mounts in line with the axis of the static primary load
- Make sure that the cut-out to be occupied by the elastomer body is free of burrs and at least 1/10 mm larger than the outside diameter of the elastomer part
- Allow for the requisite spring displacement when selecting the length of the central screw and sizing the cut-out to accommodate the mount
- When securing the flange use washers and make sure that a large, flat and smooth surface is available for force transfer from threaded fastener to elastomer part.

O-Shaped Mount

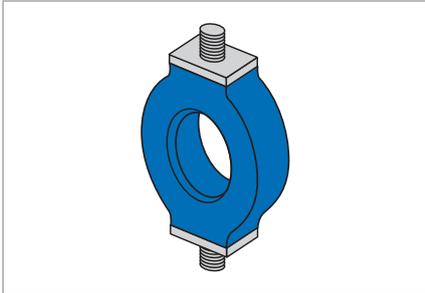

Fig. 1 O-Shaped Mount

Product description

O-shaped mounts have a very soft spring characteristic and are therefore commonly referred to as low-frequency mounts.

Product advantages

- Reduced transmission of structure-borne noise
- Compact
- Deformable in various planes
- Easily installed
- RoHS-compliant.

Application

O-shaped mounts are of a design that enables good vibration insulation for the loads that typically occur in instrumentation and control applications.

Material

Standard material	Hardness
Natural rubber NR 11	40, 45, 60 Shore A
Acrylonitrile-butadiene rubber NBR 68	60 Shore A
Ethylene-propylene rubber EPDM 22	60 Shore A

Operating conditions

Axial forces	20 N ... 215 N	Maximum permissible force
Max. temperature	up to +60 °C transient up to +80 °C for NR 11	
Min. temperature	-45 °C for NR 11	

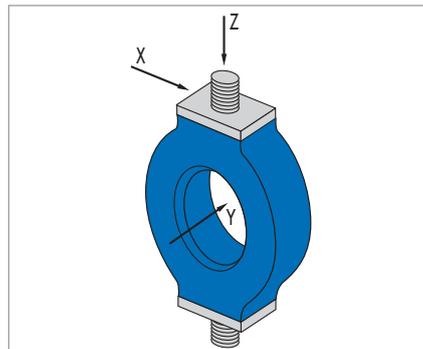

Fig. 2 Primary load directions

The spring characteristic of the O-shaped mount increases in the order X,Y and Z, whereby depending on the orientation, an optimal vibration insulation can be achieved. The primary load direction is the longitudinal axis of the threaded studs (Z direction).

Design notes

The component consists of a ring-shaped elastomer body with each flat vulcanised to securing plates with screws.

Fitting & installation

- Individual components permit slight adjustment to allow for in-situ offset
- The form of the boreholes to accommodate the threaded studs must be compliant with DIN EN 20273
- The securing plates must be in full-surface contact with the mating faces.

Top Mount

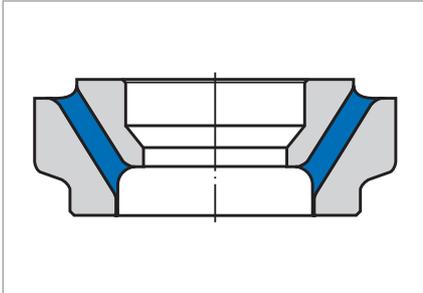

Fig. 1 Top Mount

Product description

Top mounts can permit radial, axial and angular movements.

Product advantages

- Good insulating capability in the Z direction
- Easily installed
- Spacing can be varied to suit the application
- RoHS-compliant.

Application

Top mounts are particularly suitable for connecting a dynamically loaded sub-assembly such as an engine or gearbox to a fixed assembly such as a frame.

Material

Standard material	Hardness
Natural rubber NR 11	50, 60, 70 Shore A

Operating conditions

Transverse forces in Z direction	10500 N ... 25300 N	Maximum permissible force
Max. temperature	+60 °C, transient +80 °C	
Min. temperature	-45 °C	

The mount configurations feature the same stiffness in the radial directions (X and Y direction). The ratio of stiffness in the radial direction and in the axial direction varies in considerable dependence to the tapered angle. Top mounts are designed for primary loading in the radial as well as axial directions. They are designed for pairwise use, aligned facing each other with defined axial preloading. Support mounts can permit and limit radial, axial and angular movements. The primary load direction should be absorbed in the longitudinal axis or perpendicular to it.

Design notes

A top mount consists of two tapering tubular components held together by a rubber layer.

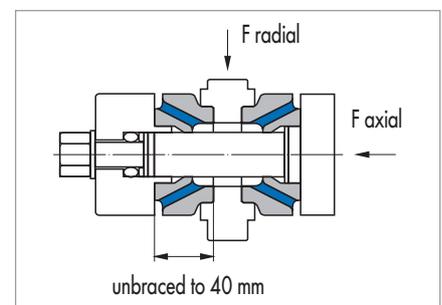

Fig. 2 Fitting & installation instructions: Top Mount with load directions

Fitting & installation

- Top mounts are designed to be secured by means of fits
- Individual components permit slight adjustment to allow for in-situ offset
- Always install top mounts centred and at right angles to the axis of primary radial loading and utilise the entire cylindrical surface area on both the inside and the outside as the bearing surfaces
- Position the mounts in counteracting pairs, positioned in such a way that the inner and outer metal parts of the top mounts are preloaded relative to each other
- The elasticity of the material permits offset to be compensated in all directions.

Spherical Roller Bearing

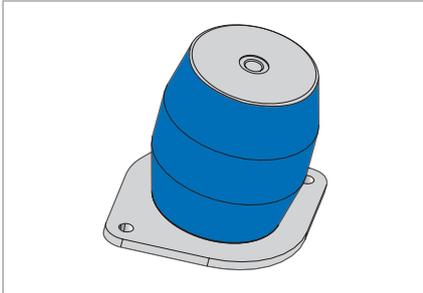

Fig. 1 Spherical Roller Bearing

Product description

Spherical roller bearings are ideal for their vertical loading and insulation against low-amplitude vibrations.

Product advantages

- Parallel fastening surfaces
- Installation with standard screws
- Prepared for heat dissipation
- Low proportion of metal
- RoHS-compliant.

Application

Masses that experience or themselves cause minor vibration amplitudes according to deflection can be mounted on spherical roller bearings. This makes this mount configuration suitable for selected engines, compressors, units, mounting equipment and also heavy duty switch cabinets, control systems, stationary control panels, measurement equipment.

Material

Standard material	Hardness
Natural rubber NR 11	45, 55, 65 Shore A

Operating conditions

Axial forces	9000 N ... 20000 N
Max. temperature	60 °C, transient +80 °C
Min. temperature	-45 °C

Spherical roller bearings have different stiffness in axial and radial direction. In the axial direction the stiffness is many times that of the radial direction.

The primary load direction is recommended to be in the longitudinal axis and central to the installation area.

Design notes

A key feature of the spherical roller bearings is the generally cylindrical to convex shape with central through-bore in the elastomer body. There is a metal plate with a central thread on one side on the front side, which is vulcanised to the elastomer body. On the opposite front side

there are several nuts vulcanised into the elastomer. The cylindrical to convex shape should be taken into account in the design of the consoles. This mount should only be used with axial preloading. Note that only small radial deflections are permitted.

Fitting & installation

- Rubber mounts are designed to be fitted vertically by means of threaded fasteners
- A sufficient radial spacing to the console components is required
- The installation areas must be free of fluids. There must be no metal shavings or sharp edges in the vicinity of the installation areas
- It is beneficial to ventilate the central bore in the elastomer body
- Radial or angular offset of the fastening areas caused by installation should be prevented
- Uniform screw tightness is required.

Layered Springs

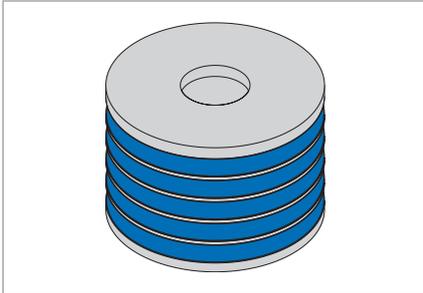

Fig. 1 Layered Springs

Product description

Layered springs are specifically used for the decoupling of horizontal vibrations. These mounts remain very stiff at the same time.

Product advantages

- Good insulating capability in the radial direction
- Compressively stiff in the axial direction
- Easily installed
- RoHS-compliant.

Application

Layered springs are resilient mounts suitable for use as bearers for subassemblies such as engines or gearboxes.

Material

Standard material	Hardness
Natural rubber NR 11	40, 50, 60, 70 Shore A
Natural rubber NR 39, 97	60 Shore A
Chloroprene rubber CR 57	60 Shore A

Operating conditions

Transverse forces in Z direction	29000 N ... 800000 N	Maximum permissible force
Max. temperature	+100 °C	
Min. temperature	-45 °C	

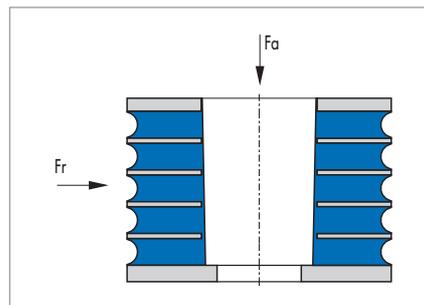

Fig. 2 Primary load directions

Layered springs have the same stiffness in the radial directions (X and Y direction) and are especially stiff in the vertical direction (Z direction). The effective stiffnesses can be varied by turning of the mount to the static load. Layered springs are designed for the primary load in the axial and radial direction but can also be loaded angled to the vertical primary load. The weight should be absorbed in the longitudinal axis for this.

Design notes

The layered spring comprises at least two metal components arranged in parallel on top of one another which are firmly attached to elastomer inserts located between them through vulcanisation. Layered Springs are designed as bearings but they can also be arranged angled to the vertical primary load.

Fitting & installation

- Individual components permit slight adjustment to allow for in-situ planar or angular offset
- Layered springs are generally installed in axial alignment with the primary load. Utilise the entire flat surface areas of the other metal parts as bearing surfaces and apply the load uniformly
- Install the mount so that the outer metal parts of the layered springs are preloaded relative to each other
- When installing angled to the vertical primary load, it is important to ensure sufficient lateral mould closing – full-surface attachment of the outer metal parts. Ensure that the outer metal parts are preloaded relative to each other.

Height Adjusters

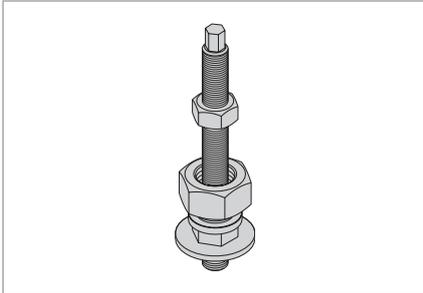

Fig. 1 Height Adjuster

Product description

Height adjusters can have an added beneficial effect on the usability of various components.

Product advantages

- Robust
- Easily installed
- Optional
- RoHS-compliant
- For optimal threaded connections, all components are corrosion-resistant according to EN 12476 Fe/Zn 6-10 ph/r/3.

Application

Height adjusters are versatile components for levelling subassemblies, gearbox mounts, reaction support links, engine mounts and compressor bearers.

Material

Standard material	Special design
Steel grade 5.8	on enquiry

Operating conditions

Thread diameter stud	
	M12, M16, M20, M24

The levelling elements, depending on design, are suitable for flanges with heights corresponding to the thread diameter and larger. The weight should be absorbed in the longitudinal axis.

Design notes

The height adjuster is an additional component for individual height adjustment to the customer application. It comprises a threaded stud with a spacer nut, two additional nuts and a washer.

Fitting & installation

- Screw the threaded end without nut of the height adjuster into the mating component a distance equal to 1,25 times the thread diameter or more
- Position the load to be levelled on the large nut and tighten the small nut as a locknut.

Rubberised Stop Washer

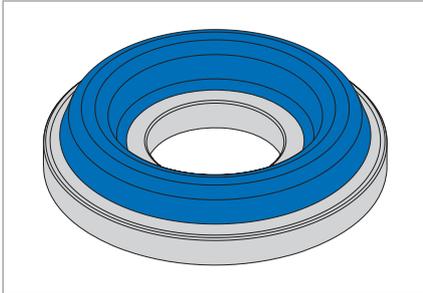

Fig. 1 Rubberised Stop Washer

Product description

Stop Washers are versatile components for effectively limiting movements.

Product advantages

- Robust
- Easily installed
- Optional
- RoHS-compliant.

Application

Stop Washers effectively limit movements of loads with moving and unmoving units, machines and stops. They are preferably used for axial path limitation with Conical Mounts or Ultra Bushes.

Material

Standard material	Hardness
Natural rubber NR 11	60, 70, 80 Shore A
Acrylonitrile-butadiene rubber NBR 68	70 Shore A

Operating conditions

Diameter, outside in mm	40, 49, 65, 75, 90
Max. temperature	+60 °C, transient +80 °C
Min. temperature	-45 °C

Elastomer-coated stop washers have different stiffnesses and damping properties primarily in dependence on the rotation cross section, the height of the elastomer pad and the elastomer as well. They have the same stiffness in the radial directions (X and Y direction) and are considerably stiffer in the axial load direction. The trapezoid design of the elastomer pads (observed in the cross section) will achieve, for otherwise equal sizes, diameters and heights, a "softer" distribution of the characteristic curve as opposed to the rectangular design. The constricted body design produces smaller stiffnesses in the axial direction and, as a rule, leads to higher service life for otherwise equal deflection. The stiffness in the axial direction increases noticeably from variant I to III. The weight should be absorbed in the longitudinal axis.

Design notes

The mount consists of a washer with or without central hole, with an elastomer pad vulcanised onto one side.

Fitting & installation

- Position stop washers centred relative to and normal to the axial primary load, and ensure that load is transferred by a smooth and flat face opposite to and making full-surface contact with the elastomer pad
- Make sure that fasteners such as screws, etc., do not restrict the range of deflection of the stop faces.

Washers and Centering Washers

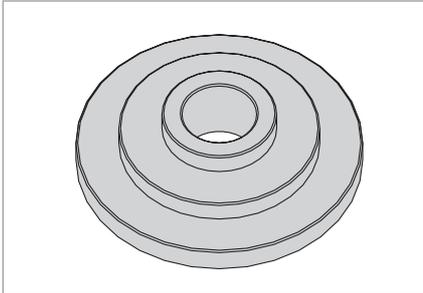

Fig. 1 Washers and Centering Washers

Product description

Washers and centering washers are simple and cost-effective add-on elements and are available in different dimensions.

Product advantages

- Robust
- Easily installed
- Optional
- RoHS-compliant.

Application

Washers and centering washers are frequently used as stops for the elastomer bodies of selected conical mounts, MO mounts and ultra bushes.

Material

Steel

min. 270 N ... 340 N

Operating conditions

Diameter, outside in mm

35, 40, 48, 50, 60, 70, 75, 80, 100, 104, 110

The weight load should be applied along the longitudinal axis.

Design notes

Washers and centering washers are additional components made of a cylindrical semifinished product. Each washer or centering washer has a central through-hole and a stepped shoulder on one face.

Fitting & installation

- It is advisable to use DIN-compliant screws and other components for fitting and installation.

Article list

Pipe Mounting Block

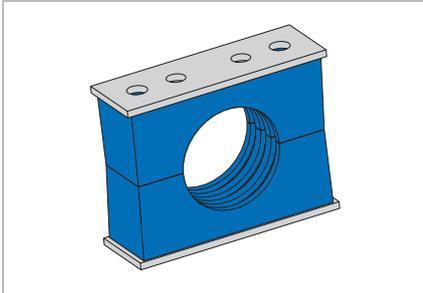

Fig. 1 Pipe Mounting Block

Product description

Pipe mounting blocks reduce the transmission of pulsation-induced vibrations from media-carrying pipes and hoses to the supporting structure. In the reverse direction they damp vibration transmission along the pipes and hoses to other anchorages.

Product advantages

- Parallel fastening surfaces
- Installation with standard screws angled according to DIN hose clamps
- Premounting with pipe unions with up to 6 pipes possible
- Different pipe diameters can be used
- "Fail-safe" behaviour within the securing screws
- High temperature resistance up to 90 °C
- Good resistance to many oils
- Good corrosion protection without chrome
- RoHS-compliant.

Material

Standard material	Hardness
Chloroprene rubber CR 57	45, 55, 65 Shore A

Operating conditions

Pipe mounting blocks can decouple hoses or pipes from the supporting structures, or damp relative movements. They have a suitable design and optimised elastomer selection for sustained temperatures up to 90 °C. The radial

Application

The main area of application is decoupling or reducing dynamic relative movement between the media-carrying hoses and pipes as well as the supporting structure. This makes these components suitable for all applications in which media are transported and high pressure pulses occur. Examples are harvesters, construction machinery, processing machines, preparation machines, stationary and mobile pressure units in which there are oil hoses or pipes.

stiffness is many times the axial stiffness. The grooves in the hose retainers are designed to decouple acoustically effective excitation amplitudes. The primary load direction is recommended in the direction of the screws.

Max. temperature	up to + 100°C, transient +130°C
Min. temperature	-30 °C

Design notes

The pipe mounting blocks have a single cubic shape and can generally hold 1 to approximately 6 and in some cases more hoses or pipes. Metal sheets for uniform distribution of the clamping forces on the individual hose holders are vulcanised in place. Sleeves for guiding the screws and positioning the metal sheets are installed. The hose holders have grooves along the bore in a circumferential direction. They are used for modifying the stiffness for small vibration amplitudes. Make sure that only small axial deflections occur.

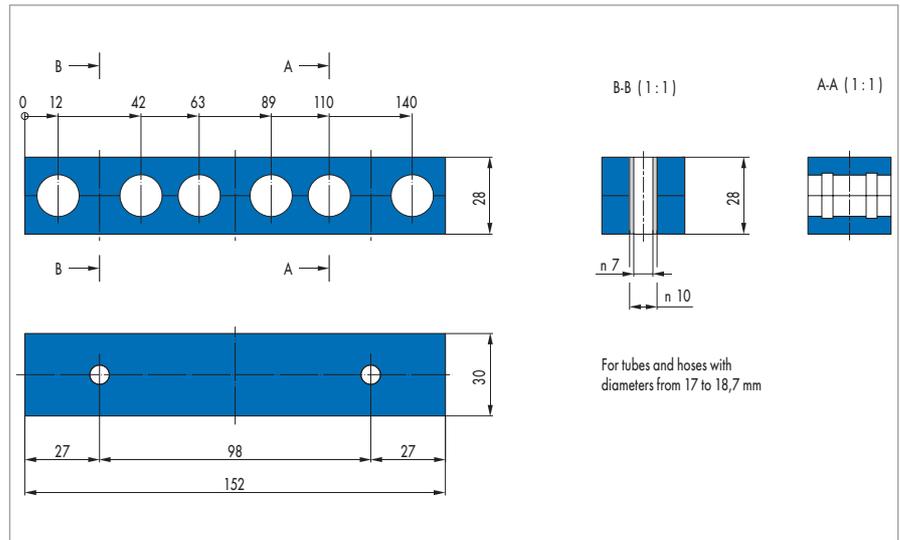

Fig. 2 Dimensional drawing Type 039 18 775

Fitting & installation

- Pipe mounting blocks are designed to be fitted by means of threaded fasteners
- Make sure that there is a closed gap between to pairs of components of the pipe mounting block
- The installation area must be free from fluids. There must not be any metal shavings or sharp edges/stones in the vicinity of the installation areas or between the elastomer bodies or between them and the metal sheets
- Make sure that all screws are installed in multiple pipe mounting blocks
- Heat accumulation under covers or similar must be avoided
- Uniform screw tightness is required.

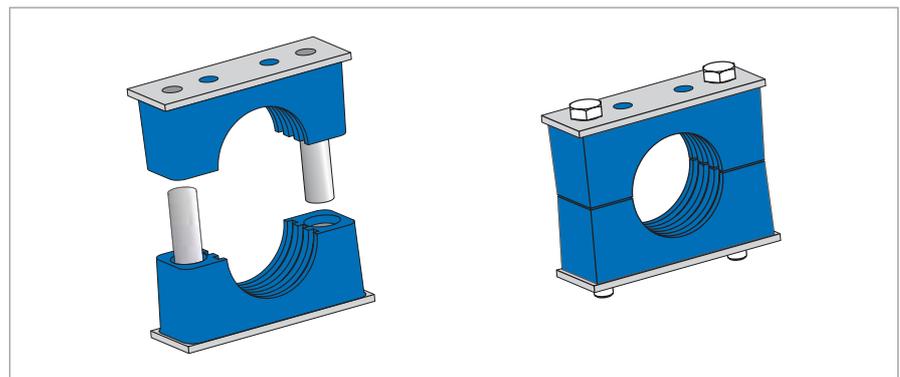

Fig. 3 Fitting & installation Type 039 18 777

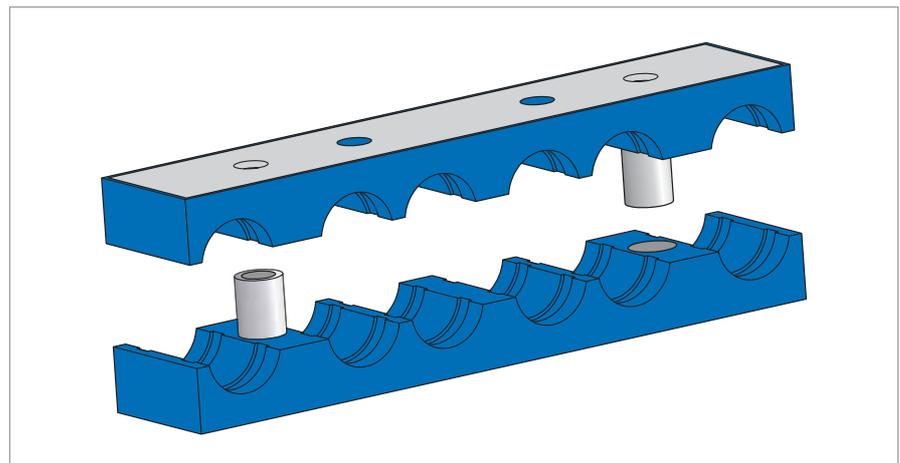

Fig. 4 Fitting & installation Type 039 18 776 HD

Rubberised Sprockets

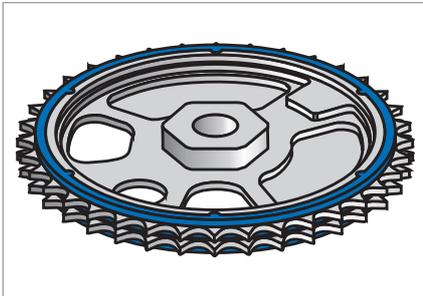

Fig. 1 Rubberised Sprockets

Product description

In the engine area chains and sprockets wheels are used to drive crankshafts and camshafts as well as auxiliary units. The advantages of chain drives are the long service life and low maintenance requirements. However, conventional chain drives tend to be relatively noisy. As a result Simrit has developed rubberised steel or sintered sprockets for high-speed chain drives. Defined elastomer pads on both sides of the sprockets make the system run more smoothly. The damping effect comes from the fact that the chain enters the elastomer before it reaches the metal sprocket surface. This effectively damps noises caused by vibrations in the chain.

Product advantages

- Long-life designs with maximum friction resistance and quiet chain running with high degree of expertise in elastomer combinations and specially developed HNBR elastomers
- Noise levels significantly reduced at medium r.p.m. by approximately 1 to 3 dB (A).

Application

- Engines with chain drives
- Steel or sintered sprockets for high-speed chain drives.

Material

Elastomer	HNBR
Sprocket	steel

Operating conditions

Media	Engine oil
Temperature	-25 ... +140 °C

Belt Pulley with Elastomer Track

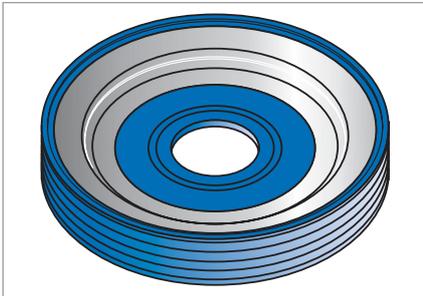

Fig. 1 Belt Pulley with Elastomer Track

Product description

The belt pulley with elastomer track is used to damp vibration and noise. Drive pulleys and drive belts are used for power transmission in motorcycles in some cases. These drive pulleys begin to vibrate at specific speed ranges and generate noise. To solve the problem Simrit has developed a drive pulley with vulcanised, defined elastomer pads. This damps the vibrations of the pulley and reduces noise.

Product advantages

- Long-life designs with a high degree of expertise in elastomer combinations and specially developed HNBR elastomers
- Significant reduction of vibrations and noise.

Application

- Spur gear drive of auxiliary units in diesel engines, spur gear of an air compressor
- Engines for construction machinery, tractors and other agricultural machinery.

Material

Elastomer	HNBR
Pulley	steel

Operating conditions

Media	Engine oil
Temperature	-25 ... +140 °C

Decoupled Chain Gear

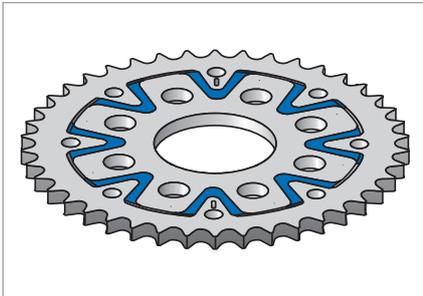

Fig. 1 Decoupled Chain Gear

Product description

In the field of engines chains and sprocket are frequently used to drive crankshafts and camshafts as well as auxiliary units. The gear teeth a contact conditions in the chain drive are similar to the geared drive. The chain links grip so deeply into the spaces between the teeth that both edges are in contact with them.

In the chain drive vibrations occur when the load on the chain is relieved. Simrit has developed a deflection wheel in the reference case that decouples the shaft from the gear wheel to prevent transmission of vibrations by bonding elastomer between the inside component attached to the shaft and the outer gear wheel. Vibrations and noise can be significantly reduced. Because the elastomer is incompressible, there is still a reliable power transmission.

Product advantages

- Significant noise reduction by approximately 1 to 3dB (A)
- Long-life designs with a high degree of expertise in elastomer combinations and specially developed HNBR elastomers.

Application

- Deflection wheel for chain drive of a diesel engine
- Steel or sintered sprockets for high-speed chain drives
- Medium and large diesel engines with sprocket/spur gear drive for construction machinery, tractors and other agricultural machinery.

Material

Elastomer	HNBR
Sprocket	steel

Operating conditions

Media	Engine oil
Temperature	-25 ... +140 °C
Pressure	max. 3 bar

Decoupled Gears

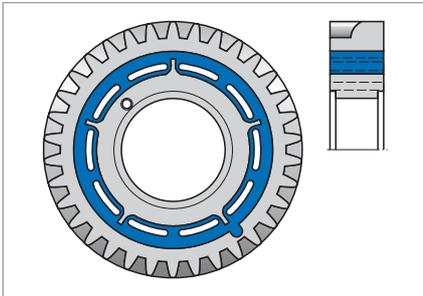

Fig. 1 Decoupled Gears

Product description

Spur gears are used to drive the camshafts and auxiliary units for diesel engines. The auxiliary units develop unwanted vibrations that cause noise and affect the smoothness. Solution: the gears are separated radially, joined by an elastomer component again and thus decoupled. Vibrations and noise can be significantly reduced.

Product advantages

- Noise reduction by approximately 1 to 3dB (A)
- Long-life designs with a high degree of expertise in elastomer combinations and specially developed HNBR elastomers.

Application

- Gears for spur gear drives
- Camshaft gear
- Medium and large diesel engines with spur gear drive for construction machinery, tractors and other agricultural machinery.

Material

Elastomer	HNBR
Spur gear	steel

Operating conditions

Media	Engine oil
Temperature	-25 ... +140 °C
Pressure	max. 3 bar

Decoupling Elements

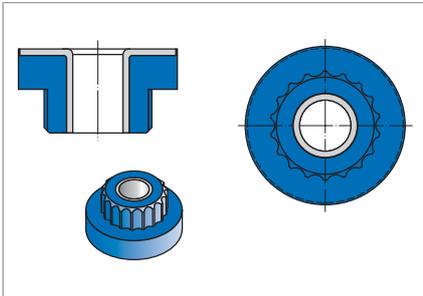

Fig. 1 Decoupling Elements

Product description

Various elastomer-metal design components are used to reduce vibrations and noise in the area of engines and auxiliary units. These components are used amongst others on the resilient attachment as well as sealing of metal components on the oil sump, the cylinder head cover on the engine block and injector valves. One example in the engine controller of commercial vehicles, which is attached to the vehicle with screws. Elastomer composite components are used for resilient vibration-decoupling attachment.

Product advantages

- Decoupling of structure-borne noise and vibrations
- Reduced components by use of elastomer composite components
- Application-specific design with a wide range of elastomers.

Application

- Resilient attachment as well as sealing of metal components on the oil sump, cylinder head cover on the engine block, injector valves
- Attachment of engine controller (electronic)
- Engines and auxiliary units for construction machinery, tractors and other agricultural machinery.

Material

Composite component of metal and elastomer (with/without bond)

Elastomer	VMQ with low hardness (Shore)
Support component	steel

Operating conditions

Media	Engine oil, spray
Temperature	-25 ... +140 °C
